TO STUDY EPIDEMIOLOGY, CLINICAL AND MICROBIOLOGICAL PROFILE OF INFECTIONS IN PATIENTS ADMITTED TO SURGICAL ICU

A THESIS SUBMITTED TO

BABA FARID UNIVERSITY OF HEALTH SCIENCES, FARIDKOT (PUNJAB)

IN THE PARTIAL FULFILLMENT

FOR THE AWARD OF DEGREE OF

DOCTOR OF MEDICINE

IN

MICROBIOLOGY

MAY 2024

Submitted By

DR AMARPREET KAUR

DEPARTMENT OF MICROBIOLOGY
DAYANAND MEDICAL COLLEGE AND HOSPITAL
LUDHIANA, PUNJAB

DECLARATION BY THE CANDIDATE

I hereby declare that the thesis entitled "**TO STUDY EPIDEMIOLOGY, CLINICAL AND MICROBIOLOGICAL PROFILE OF INFECTIONS IN PATIENTS ADMITTED TO SURGICAL ICU**" submitted towards partial fulfillment of the requirements for the award of **MD in Microbiology** degree to BFUHS is a compilation of original work carried out by me under the supervision of **Dr. Veenu Gupta,** Professor& Head, Department of Microbiology and **Dr. PL Gautam,** Professor & Head, Department of Critical Care Medicine. No part of this thesis has formed the basis for the award of any degree previously.

Dedicated

to

My Father

Sh. Gurdip singh

Thank you for always believing me, your unwavering support, blessings and encouragement have been cornerstone of my academic journey.

ACKNOWLEDGEMENT

I am grateful to GOD Almighty for His grace and blessings which enabled me to tide over the thick and thin during the course of my thesis. Wherever I faltered along the way, he was always there to light me up in his lap like an endearing parent to tide over obstacles. Endeavour, no matter how spirited and consistent does little to steer one, unless coupled with discrete guidance. With great pleasure I take this opportunity to thank all those who helped me in the successful completion of my work.

I gratefully acknowledge the patience, keen personal interest and guidance rendered by my esteemed & revered teacher, mentor and Chief Supervisor ***Dr Veenu Gupta****, Professor and Head, Department of Microbiology, Dayanand Medical College and Hospital, Ludhiana. Her innovative ideas and accommodative attitude helped me at various stages during the culmination of this project. I consider myself privileged to be her student. I deem myself singularly blessed of I being showered with parental love, guidance, constructive criticism and inspiration of the ever active. This project could never have been brought to a realization without her dedicated involvement, patient hearing and enthusiastic help at each and every step of this journey. Her thorough knowledge of the subject and pursuit for perfection has been a constant inspiration.*

I would like to sincerely thank my co-supervisor, ***Dr. P.L Gautam****, Professor & Head, Department of Critical Care Medicine, DMCH, Ludhiana without whose guidance the aim of my study could not have been accomplished. His knowledge about the subject is overwhelming.*

*I wish to express my deep & heartful gratitude for my esteemed teachers **Dr Rama Gupta**, Professor, Department of Microbiology and **Dr Jyoti Chaudhary**, Professor, Department of Microbiology, DMCH, Ludhiana. Their constant kindness, meticulous care, untiring help and constructive suggestions helped me throughout my study.*

*Words should be amiss without a mention of **Dr Eshani Devan**,**Dr Menal Gupta** and **Dr Manisha Aggarwal** for their invaluable suggestions & opinions & constant support that helped tremendously in completion of this project.*

*I am also indebted to **Dr G.S Wander**, Principal, DMCH, Ludhiana for providing all the necessary facilities in the department.*

*I am grateful to**, Dr Harmandeep Kaur** been constantly guiding through my thick and thin in every aspect and understanding me without me even saying anything and offering solution to every problem I faced.*

*I would like to thanks my seniors **Dr Bavleen Kaur** and **Dr Divjot Singh** for providing me the never ending help and support throughout the study.*

*I am thankful to my colleagues **Dr Sejshi** and **Dr Sabri** for their constant help throughout three years. We have shared our worries, frustations and ultimate happiness in eventually finishing this project.*

*I would also like to thank the little ones, **Dr Manav** and **Dr Prabhdeep** for their constant support & help.*

Parents are always a perpetual source of inspiration & encouragement. No words can express what their constant undemanding love, sacrifice, dedication & prayers have done to achieve me whatever I am today. A very sincere thanks to

my Mom Smt ***Kulwant Kaur*** *and Dad Mr* ***Gurdip Singh****. The lessons and values they have taught me have helped me become stronger person.I owe a special reverence because contrary to all odds they had given me the best possible education. Without their guidance, encouragement and blessings,I would never have been what I am today. Words cannot express my deepest gratitude to my brother,* ***Gurjap Singh.*** *His love and support has helped me to tide over the challenging times. He has been my constant support in every step of this journey.*

I would like to thank my nanaji ***Sh. Baldev Singh*** *for his always needed encouragement and support-special mention brother* ***Evenpreet Singh.***

My sincere appreciation for the encouragement and stimulation extended by friends ***Dr Abhinav, Dr Harleen****,* ***Dr Simrat*** *and* ***Dr Sukhkamal*** *for their constant motivation, and cooperation at every step of this journey.*

I would also like to thank all the technical staff of my department for their constant support and ***Mrs Hardeep*** *for her constant encouragement.*

Last but not the least I would like to thank ***Mrs Namita Bansal, Mr Tarun*** *and all the R&D staff for their skillful analysis & typing of the manuscript.*

I acknowledge the help of all those invisible hands who are responsible for the successful outcome of this dissertation.

Dr Amarpreet Kaur

ABSTRACT

INTRODUCTION: Patients in intensive care units (ICUs) are at high risk for healthcare-acquired infections (HAI) due to the high prevalence of invasive procedures and devices, comorbidity, and increased age. In the absence of precise microbiological data, treatment is started with broad spectrum antimicrobials, without discrimination, resulting in antimicrobial resistance.

AIMS & OBJECTIVES OF THE STUDY: To study the Epidemiology, Clinical and Microbiological profile of infections in patients admitted to Surgical ICU.

MATERIAL AND METHODS: The study was a prospective study which was conducted over a period of one year in the Department of Microbiology, DMCH Ludhiana. All patients admitted in Surgical ICUs were included in the study. The specimens received were cultured and antimicrobial susceptibility pattern was determined according to standard protocol. The detailed clinical profile and risk factors was studied in these patients to correlate the outcome. The data obtained was statistically analysed.

RESULTS: Over a period of one year, 1010 patients were admitted and infections were present in 345 patients with infection rate of 34.2%. Total 376 bacterial infections were identified, among which 225(59.8%) infections were community acquired and 151(40.2%) were hospital acquired. A total of 420 isolates (83.8% Gram negative and 16.2% Gram positive) were obtained. *Escherichia coli* (29.8%) was most common organism followed by *Klebsiella pneumoniae* (26.2%).Out of 420 bacterial isolates, 350 (83.3%) were multidrug resistant, 279 (66.4%) were extensively drug resistant. Out of 345 patients, 227(65.8%) survived and 118(34.2%) expired.

CONCLUSION: Infections are an important cause for prolonged hospitalisation, leading to increased treatment costs so this study was useful for checking antibiotic susceptibility pattern and early treatment of patients. Also adequate precautions and hand hygiene while insertion of devices can help in preventing the spread of resistant organisms.

KEYWORDS: community acquired, hospital acquired, Gram negative, Gram positive

INTRODUCTION

Infection is a common occurrence among patients in the intensive care unit (ICU) and low and middle-income countries.[1] Infections in ICUs are predominantly due to severely ill patients surrounded by an environment of equipment, resistant microbes, and overworked healthcare workers. The prevalence of infections in the ICU is more than double that in the general ward.[2,3,4] These infections amount to a substantial global burden in terms of morbidity, mortality, and financial costs.[5] Although mortality due to infections has decreased in the last 30 years, they are still considered a crucial cause of disability and death.[6,7]

A recently published World Health Organization (WHO) review revealed that the frequency of ICU-acquired infections in low- and middle-income countries is at least 2–3 times higher than in high income countries. Additionally, device-associated infection densities in these countries are up to 13 times higher than in the USA.[1] The prevalence of ICU-acquired infections is higher in developing countries as compared to developed countries, ranging between 4.4% and 88.9%.[8]

The WHO estimates the rate of hospital-acquired infections (HAIs) is 7%–12% among hospitalized patients worldwide. More than 1.4 million people had infection-related complications during their stay in the hospital at any time.[1] The South-East Asia Region contributes 27% of the global burden of infectious and parasitic diseases and 30% of respiratory infections.[9]

Several risk factors contributing to such HAI include extremes of age, gender, and APACHE 2 score at the time of admission to the ICU. The following factors may lead to the development of ICU-acquired infections: underlying medical conditions, comorbidities, catheterization, endotracheal intubation, mechanical ventilation, surgical procedures, diabetes mellitus, chronic alcoholism, and an immunocompromised state.[10] The duration of ICU stay is also an independent risk factor for acquiring infection. It is because the

duration for which the devices remain inserted increases with the length of the ICU stay, which further leads to colonization with potential microorganisms, thereby causing infection.[5] Endotracheal intubation with mechanical ventilation increases the risk of nosocomial pneumonia by 6 to 21 times.[11] Central venous catheterization is a major contributor to nosocomial bloodstream infections, accounting for 97% of all nosocomial bloodstream infections.[12] Urinary catheterization and nasotracheal intubation are crucial risk factors for acquiring nosocomial urinary tract infections and sinusitis, respectively.[13] Various microorganisms predominant in hospitals cause nosocomial infections (NIs), making patients in Surgical Intensive Care Units (SICU) prone to them.

Characteristics such as the type of surgical wound, type of surgery, duration of preoperative hospitalization, and the need for blood transfusions make patients in SICU prone to NI.[14] These factors are related with a higher risk of the occurrence of nosocomial infections.

Patients in the Surgical ICU are known to have various infections such as bacterial, viral, fungal, and parasitic; among them, the incidence of bacterial infections is the highest. The European Prevalence of Infections in ICU (EPIC-1 and EPIC-2) has reported a high incidence of bacterial infections in European countries.[15,16]

In ICUs, infections must be classified for surveillance purposes, which involves categorizing them based on their site, the involved microorganisms along with their antibiotic susceptibility, and distinguishing between community-acquired and hospital-acquired infections.[17] A time cutoff of 48 hours is used to differentiate between community-acquired and hospital-acquired infections. However, it is not always a “true” HAI as causative organisms can be a patient’s flora and do not belong to the ICU microbial ecology.[18]

The most commonly ICU-acquired infections are pneumonia (including ventilator-associated pneumonia (VAP)), catheter-associated urinary tract infections (CAUTI), surgical site infections (SSI), and central-line associated bloodstream infections (CLABSI).[8,19,20] Respiratory Tract

Infections (RTI) are reported as the most common infection, followed by Urinary Tract Infections (UTI).[17,21] Peritonitis accounts for up to 65% of all abdominal infections observed in ICU patients (WHO, 2012). Therefore, these infections require early source control and appropriate antimicrobial therapy.[19]

SSIs are present in 2%–5% of patients undergoing surgery. These infections result of the endogenous microflora of the patient. The incidence of infection may be as high as 20% depending on the procedure of surgery.[22]

The predominant organisms causing hospital-acquired infections are *Acinetobacter*, *Pseudomonas*,*Klebsiella*, and *Escherichia coli*.[17] Gram-negative bacilli predominate both in and out of the ICU.[21,23] S. aureus was the most common Gram-positive organism.[24] The development of drug resistance among these organisms may contribute to higher morbidity and mortality rates in patients, prolonged hospital stays, and increased hospital costs.[25]

The study from the National Nosocomial Infections Surveillance (NNIS) system proved a higher incidence of gram-negative organisms such as *Escherichia coli*, *Klebsiella pneumoniae*, *Acinetobacter*, *Pseudomonas*, and drug-resistant gram-positive organisms like methicillin-resistant *Staphylococcus aureus*, vancomycin-resistant *Enterococ*ci, and others.[26] Data from the Hospital Infection Control Committee (HICC) suggests high resistance of Gram-negative isolates towards cephalosporins, carbapenems, aminoglycosides, and quinolones. Gram-positive groups show resistance against penicillin, followed by ciprofloxacin.[27]

Self-medication, incorrect dosage, and prolonged use of antibiotics cause antibiotic pressure, which leads to the development of antimicrobial resistance. This, in turn, exacerbates the financial burden.[27] Twenty-two to eighty percent of *E. coli* isolates are multidrug-resistant.[24] This demonstrates that multidrug resistance poses a significant global public health challenge.[28] These patients are at higher risk of morbidity and mortality.

The incidence of fungal diseases such as *Candida* and *Aspergillus* species is increasing among critically ill patients. Data from the USA suggests that Candida is the fourth most common microorganism responsible (5–10% of infections), while in European studies, it is between the 6th and 10th most common cause. Mortality associated with candidemia may be as high as 40%, whereas infections caused by non-albicans species are associated with worse outcomes.[29]

The need to prevent the occurrence and spread of infections and antimicrobial resistance has become a public health priority.[30] It can be controlled by practicing judicious use of antimicrobials and adopting antibiotic restriction policies. All participants need to make efforts to control nosocomial infections. Proper training of hospital staff in biosafety and proper waste management also helps reduce nosocomial infections.[22]

AIMS AND OBJECTIVES OF THE STUDY

- To study the Epidemiology and Clinical Profile of infections in patients admitted to Surgical ICU.
- To study the Microbiological profile of infections.

REVIEW OF LITERATURE

Nosocomial infections constitute one of the most challenging tasks to deal with in a hospital setting.[17] They pose a significant risk to patients' safety in all healthcare facilities.[31] However, the occurrence is much higher in the Intensive Care Units (ICUs) than in other hospital areas.[32,33] ICU-acquired infections are associated with increased length of ICU and hospital stays.[34] The load of hospital-acquired infections (HAI) significantly influences the patient's cost of medical treatment and enormously impacts the economy of a developing country like India.[17] A study conducted by Correa and Pittet reported an additional cost of about $3.5 billion per year.[35] Knowledge of the infection rates, sources, pathogens involved, and common risk factors is key to preventing ICU-acquired infections. The incidence of nosocomial infections differs depending upon the hospital setting, type of hospital or ICU, the patient population, and surveillance techniques used to identify infection.[18]

In general, of all the hospital-acquired infections, 20–25% were ICU-acquired.[36] There may be variations in the incidence of ICU infections between centers, depending upon the characteristics of patients and ICUs. A point-prevalence study conducted in 17 European countries, which included 1,417 centers, reported an infection rate of 20.6% in ICUs. A study conducted by Aly et al. reported infection rates in ICUs to be 10.6%.[37]

The HAI prevalence rate was 6.8% in a point prevalence survey conducted by Azzam and Dramaix in Lebanon.[38] ICUs had the highest rates of HAIs, followed by the medical wards. ICU patients are more expected to be critically ill and to undergo multiple invasive procedures and indwelling lines, so the majority of HAIs occur in the ICUs.[39,40] In a prospective survey conducted in a tertiary care hospital in Abu Dhabi, three areas were involved: the ICU, male orthopedic ward, and general surgery ward. Hospital-acquired infection rates were highest among the ICU patients (29.1%) followed by patients of the male orthopedic ward and general surgery ward (6.5% and 5.7%, respectively).[41]

In a retrospective cohort study carried out in patients who survived hospitalization, 20.7% died after leaving the ICU. While comparing the groups of survivors and non-survivors, the median age was higher among non-survivors.[42] Longer hospital stays were observed among non-survivors.

In a study of 125 Italian intensive care units, the incidence of ICU-acquired infections was 9.1%.[43] In Spain, data were taken from 20 ICUs, representing a rate of 9.3%.[44] Malacarne and colleagues reported that the rate of new ICU-acquired infections was 9.3%.[43]

Alberti C, Brun-Buisson C, et al. conducted a cohort study that reported at least one ICU-acquired infection in 18.9% of patients. The overall incidence of infection was 21.1%, with frequencies of community-acquired and hospital-acquired infections being 11.9% and 9.2%, respectively.[45] In a prospective longitudinal study carried out in Libyan national hospitals, out of 22,170 hospitalized patients in four hospitals, infection was reported in 13.7% of patients.[46]

In a 1-day point prevalence study (extended prevalence of infection in intensive care [EPIC II]), 1265 ICUs from 76 countries were involved. Nosocomial infections were present in 51% of patients. Greece and Portugal have the highest infection rate, Switzerland, Germany, and the Netherlands have the lowest.[47] Other studies have reported that trauma patients are at high risk for developing infection. Out of a total of 563 patients, 86% sustained blunt traumatic injuries, of which 37% experienced 367 infections, with an incidence of 32.1 per 1,000 patient-days.[48]

National Nosocomial Infection Surveillance System conducted a seven-year-long survey on 500,000 patients admitted to 205 combined medical-surgical ICUs. The rate of ICU-acquired infections was 6.1%.[49] Recently, researchers conducted a retrospective French survey on patients over 80 years old. This study showed a rate of ICU-acquired infection of 16.5% in older patients, compared to a rate of 13.9% in younger patients.[50]

The more commonly identified risk factors associated with nosocomial infections can be divided into four groups: those related to (a)

underlying health impairment; (b) acute disease processes; (c) use of invasive procedures; and (d) other treatment modalities. Various studies have described chronic lung disease, immunocompromised status, increased age, malnutrition, etc., as independent risk factors for acquiring nosocomial infections.[48,51,52] It has been reported in some studies that the risk of developing nosocomial infections increased with a high APACHE II score.[53,54]

The use of invasive devices such as central venous or urinary catheters, intubation, tracheostomy, and mechanical ventilation has been reported as significant risk factors for infection.[53] The EPIC II study reported that medical admission, admission after emergency surgery or trauma, referral from the emergency room, or other hospitals, the presence of chronic obstructive pulmonary disease, cancer, HIV, older age, mechanical ventilation, and renal replacement therapy were autonomously associated with a higher risk of infection.[15]

Crude infection rates do not explain the patient's intrinsic risk of infection or extrinsic risks associated with medical interventions.[55] Other factors that may also be accountable include ICU type, length of stay, rate of device utilization, and discharge criteria. There may be different risk factors for infection concerning the severity of illness and utilization rates of invasive devices in patients from a single institution. Mechanical ventilation, coma, trauma, nasogastric tube placement, and APACHE II scores were deemed significant risk factors for nosocomial infection. The rate of nosocomial infection increased with the number of these risk factors.[53]

While considering the risk factors, it was found that admission APACHE II score, presence of peritonitis, pancreatitis, antibiotic use, and mechanical ventilation are the risk factors for nosocomial infection.[30] In another study, age, simplified acute physiology score II score at onset of bloodstream infection, colistin resistance, and aminoglycosides were independent predictors of *Klebsiella pneumoniae* infection in the ICU.[56].

MDR pathogen infections are not directly associated with a poor prognosis, but inappropriate antibiotic therapy may increase the risk of mortality. The most significant risk factors for developing MDR pathogen infections are the presence of a prior colonization status or recent infection caused by MDR pathogens, broad-spectrum antibiotic use during the preceding 90 days, invasive procedures (e.g., abdominal surgery), prolonged mechanical ventilation (>48 h) or ICU stay, recent hospitalization for at least five days in the past 90 days, and immunosuppression.[57]

In a retrospective cohort study conducted by McCusker ME, Perisse AR found that the need for mechanical ventilation on ICU Day 1 and transfer to another unit ICU were independent predictors of nosocomial infections.[58] However, no study has shown the direct association between a particular organism and a particular infection site on mortality.

An analysis of ICU surveillance data collected from the National Nosocomial Infections Surveillance (NNIS) System, 87% of primary bloodstream infections were associated with central lines, 86% of nosocomial pneumonia was associated with mechanical ventilation, and 95% of urinary tract infections were associated with urinary catheters.[49]

In the EPIC II study conducted by Vincent JL and Rello J, the most commonly reported sites for ICU-acquired infections were the lungs (64%), followed by the abdomen (19%), and bloodstream (15%).[16] Nosocomial pneumonia accounted for 31% of all nosocomial infections followed by urinary tract infections and bloodstream infections.[49] The pattern of causative organisms fluctuates between countries and between ICUs according to the site of infection, antibiotic protocols, infection control practices, and local ecology and resistance patterns.[59] Although swings in the pathogen pattern have been observed in recent years, Gram-negative infections still predominate in the ICUs.[47,49,60]

In the study conducted by Pittet and Wenzel[34] and Edgeworth et al.[61], Candida species were detected in 15% of isolates, indicating that

fungal pathogens are also becoming increasingly common among patients with nosocomial bloodstream infections..

The study conducted by Goyal et al. concluded that out of 2492 blood culture samples, 11.87% were identified as culture positive. Among these, 252 (85.13%) were Gram-negative isolates, 12.83% were Gram-positive isolates, and 2.02% were other organisms (contaminants). The predominant gram-negative organism isolated was *Klebsiella pneumoniae*(29%), followed by *Escherichia coli* (28%)and *Acinetobacter baumannii*, which showed maximum sensitivity to colistin (81.40%) followed by amikacin (15%). The most frequent gram-positive isolate was *Staphylococcus aureus* (63.15%), followed by *Enterococcus faecalis* (36.84%), which showed maximum sensitivity to vancomycin (92.10%), followed by linezolid(86.84%).[62]

Most (88.8%) blood cultures were mono-microbial, with 10% containing two and 1.2% more than two pathogens, resulting in 2927 bacterial and fungal isolates. Pathogens were most commonly Gram-negative (1726/2927; 59%), with a predominance of *Klebsiella spp*.(27.9%), followed by *Acinetobacter spp*(20.3%) ,*Escherichia coli*(15.8%), *Pseudomonas spp* (14.3%).When analysing Enterobacterales, *Pseudomonas spp*, and *Acinetobacter spp*., Pan Drug Resistance was present in 1.5%.[63]

In a prospective observational study conducted in 13 countries, the most frequent nosocomial LRTI was VAP (52.5%), followed by ICU-acquired pneumonia not receiving invasive mechanical ventilation (ICU-HAP) (9.2%). Most of the patients were admitted to the ICU due to medical diagnosis (66%), followed by emergent surgery (15.4%) and trauma (9.6%). The most frequently identified microorganisms were *P. aeruginosa* (18.4%), followed by *Klebsiella spp*. (14.4%) and *A. baumannii*(11.0%).[64]

In a prospective observational study conducted in Eastern India, Gram -negative Enterobacteriaceae were the most frequently isolated pathogens. *Pseudomonas aeruginosa* was the single most common causative organism.[10] Nosocomial pneumonia, including both ventilator and nonventilator-associated cases, is the most frequently

detected infection, and MDR pathogens are common among late-onset cases of VAP. Similar rates of causative agents were identified in patients with early versus late-onset VAP, which may be due to the rise in MDR pathogens. Local ICU ecology is the most predominant risk factor for acquiring MDR pathogens, irrespective of the length of intubation.[65] However, it is necessary to initiate antimicrobial therapy that will be immediately effective while avoiding overuse of extended-spectrum antimicrobials.

In a retrospective, single-center study conducted in a tertiary care center in West Asia, Gram-negative bacterial organisms accounted for 38.4% of bloodstream infections (BSI), followed by Gram-positive bacteria (37.4%), whereas fungi accounted for the remaining 24.2%.[66]

In recent years, the high proportion of resistant strains among Gram-positive bacteria has led to intense efforts to discover new antibiotics effective against these microorganisms. Antibiotics such as telavancin are active against VRSA and VRE.[67] On the contrary, little or no progress has been made in treating multi-drug resistant Gram-negative infections. They are a severe threat in many ICUs.[68] The lack of new antibiotics has resulted in the revival of older antimicrobial agents, such as colistin, which was abandoned due to its toxicity profile. Colistin is the only antibiotic effective against *Acinetobacter baumannii* or *Klebsiella pneumoniae.*[69]

Gram-negative organisms were responsible for most HAIs. In two tertiary care hospitals in Jeddah in 2001, the prevalence of MRSA was found to be 33%.[70] Most of these isolates were from the ICU, followed by the general medical wards. MRSA in hospitals has increased from < 3% to over 30% within the past three decades in major cities in the USA.[71] More alarming is the rise in the number of community-acquired infections with MRSA and the significant economic impact it has on the medical care system.

Crude mortality rates in ICUs vary from 12% to 80%,[59] whereas some studies have described increased mortality associated with nosocomial infections;[8] other studies, like those of Rello et al., have not shown higher mortality.[16] In the study performed by Rosenthal et al., the

crude mortality rate for patients with device-associated infections ranged from 50.67% (for central venous catheter-associated bloodstream infection) to 42.32% (for VAP).[72] This lack of difference could be due to variations in the baseline severity of illness. Mortality associated with multiple organism bacteremia is 48%, and single organism bacteremia is 25%.[30]

Sepsis causes a significant number of deaths among patients admitted to general and surgical ICUs.[73] In the Extended Prevalence of Infection in Intensive Care (EPIC II) study, in a cohort of 13,796 adult patients from 75 countries, the point prevalence of sepsis in the ICU was 51%. 71% of patients were receiving antibiotics on the day of the study. Infections in the ICU were an independent predictor of mortality, with an estimated OR of 1.51 ($p < 0.01$).[74]

MATERIALS AND METHODS

The study was prospective study, conducted in the Department of Microbiology, DMCH Ludhiana. All the patients admitted to the Surgical ICU were included in the study and monitored for any infection.

SOURCE OF DATA

Depending on the requisition, various samples received in the Microbiology department were processed.

METHOD OF COLLECTION OF DATA

Inclusion Criteria: All patients admitted to Surgical ICU

Exclusion Criteria: All Patients admitted to OPD, wards.

- The following data is collected: Name, age, sex, date of admission, MRD No., Date of specimen collection,
- Risk factors,
- Severity of Episodes (APACHE 2 score),
- Investigations,
- Empirical Treatment,
- Provisional diagnosis
- Target treatment,
- The outcome was recorded in a preformed proforma.

DURATION OF STUDY

The present prospective study was conducted over a period of 1 year in Department of Microbiology, Dayanand Medical College and hospital, Ludhiana.

SAMPLE COLLECTION

- **Blood sample** – Under all aseptic conditions, 10-20 ml of blood was withdrawn from an antecubital vein with a disposable syringe and inoculated directly into commercially available BACTEC 9240 or BacT/Alert culture bottles.
- **Body fluids**- Under aseptic conditions, body fluid samples were collected in a sterile universal container.

- CSF sample was collected aseptically by lumbar puncture into sterile glass vials.
- **Respiratory samples-**
- ET aspirate sample- It was collected by introducing a catheter through the larynx into the trachea. If an endotracheal tube is in place or tracheostomy has been done, the tracheal secretions was aspirated in a sterile screw capped container.
- BAL sample- It was collected by injecting 30 to 50 ml of physiologic saline through a fibroptic bronchoscope. The saline was aspirated & sent in sterile universal container.
- **Urine** - Under aseptic conditions, urine samples from catheterized patients were collected with a disposable syringe from the sample collection port.
- **Pus/ Wound swab/Tissue** - Under aseptic conditions these samples were collected in sterile universal container/sterile swab stick.
- **Stool-** Stool was collected in sterile, clean, wide-mouthed container without contamination with urine, water and disinfectants.

SAMPLE PROCESSING

Various specimens like blood, body fluids, CSF, respiratory (ET secretions, BAL, sputum) urine, pus/ wound swab/ tissue, stool received in Microbiology lab were processed as per standard protocols.[75]

DIRECT EXAMINATION-

- Gram staining was performed directly from the sample.
- KOH mount- 10-20% KOH was used for identification of fungal elements.
- ZN staining –was done for detection of acid fast bacilli.
- For CSF samples-wet mount preparation, India ink preparation, bacterial antigen and Cryptococcal antigen tests were done.
- For stool samples-saline and Iodine mount preparation, immunochromatographic test for Cryptosporidium / Giardia /

Entamoeba and GDH, Toxin A/Toxin B for Clostridium difficile were processed as indicated/requested

BACTERIAL CULTURE-

- Blood and body fluid specimens were processed in the BACTEC 9240 or BacT /Alert microbial detection system. Blood culture bottles was loaded in the instrument and incubated for a maximum period of 7 days or till the bottle flagged by the system and time of positivity was noted. Smears were prepared from positive blood culture bottles and gram staining was done. The Positive bottles were subcultured on Blood Agar and MacConkey agar plates.
- Urine, respiratory samples, pus, wound swabs etc. was cultured on blood and MacConkey agar and incubated at 37*C for 24-48 hrs.
- Identification and AST (antibiotic susceptibility testing) of the isolates was done by Vitek 2 system.
- **Composition of the media-**
- **Blood Agar**
- The medium was prepared by adding sterile blood (5-10 %) to sterile nutrient agar that has been melted and cooled to 50˚ C. Double-layered blood agar was prepared. A thin layer of melted nutrient agar, about 7 ml for a 9 cm petri dish, was poured and allowed to set. Then a thin layer of 5 % blood agar was poured on top of the first layer.
- **MacConkey's Agar-**
- **Composition:**
- Peptone 20g
- Sodium taurocholate 5g
- Water 1L
- Agar 20g
- Neutral red solution, 2% in 50% ethanol 3.5mlLactose, 10% aqueous solution100ml
- **Preparation-** The peptone and taurocholate were dissolved in water by heating. To this, agar was added and dissolved in the steamer or autoclave.PH was adjusted to 7.5. Lactose and neutral

red were added and mixed. Then, it was autoclaved at 121 ^{0} C for 15 minutes at 15 psi pressure.

- **AUTOMATED BLOOD CULTURE SYSTEMS:**
- **Bac T/ Alert**
- **Principle-**
- The Bac T/ Alert blood culture system utilizes a colorimetric sensor and reflected light to monitor the presence and production of carbon dioxide (CO2) dissolved in the culture medium. If microorganisms are present in the test sample, CO2 is produced as the organisms metabolize the substrates in the culture medium. When growth of microorganism produces CO2, the color of the gas-permeable sensor installed in the bottom of each culture bottle changes from blue-green to yellow. The lighter color result is an increase of reflectance units monitored by the system.
- **BACTEC 9240 BLOOD CULTURE SYSTEM-**
- **Principle-**
- Bactec 9240 blood culture system uses fluorescent sensor to monitor the presence and production of CO2 dissolved in the culture medium. If microorganisms are present in the test sample, CO2 is produced as the organisms metabolize the substrates in the culture medium. When growth of microorganism produces CO2, its sensor emit a fluorescent light that passes an emission filter on the way to a light sensitive diode.
- **ANTIMICROBIAL SUSCEPTIBILITY TESTING[76]**
- It was done by the Vitek-2 panel. Identification of Gram-positive and Gram-negative was done by using AST-GP628 card and AST-GN406/407 cards respectively. For Gram-positive organisms drugs used were benzylpenicillin, oxacillin, gentamicin, ciprofloxacin, levofloxacin, erythromycin, clindamycin, daptomycin, linezolid and vancomycin. For Gram-negative organisms, AST-GN406 card test and AST-GN407 containing antibiotics amikacin, gentamicin, ciprofloxacin, ampicillin, cefepime, levofloxacin, ceftriaxone, cefuroxime, ceftazidime, amoxicillin / clavulanic acid,

cefoperazone/sulbactam, piperacillin/tazobactam, imipenem, meropenem, ertapenem, trimethoprim-sulfamethoxazole, aztreonam, minocycline,and tigecycline was used. Colistin susceptibility testing was done by the Broth Microdilution Method(BMD). For urinary isolates, norfloxacin instead of ciprofloxacin and nitrofurantoin were used.

Yeast identification was done by YST-408 card which contained amphotericin B, fluconazole, flucytosine, voriconazole and caspofungin.

- **Quality control-**ATCC strains of *Escherichia coli* 25922, *Pseudomonas aeruginosa* 27853 and *Staphylococcus aureus* 25923 were used as quality controls.

CHARACTERIZATION OF ISOLATES:-

The isolates were characterized based on antibiotic resistance as follows:[77]

- MDR: The isolates acquired non-susceptibility to at least one agent in three or more antimicrobial categories.
- XDR: The isolates showed non susceptibility to at least one agent in all but two or fewer antimicrobial categories (i.e. bacterial isolates remain susceptible to only one or two categories)
- PDR: The isolates showed non-susceptibility to all agents in all antimicrobial categories.
- In Salmonella spp. multi-drug resistance (MDR), defined as resistance to ampicillin, chloramphenicol, and trimethoprim-sulfamethoxazole.

MYCOBACTERIAL CULTURE- After decontamination/ centrifugation/homogenization, samples were cultured on Lowenstein Jensen(LJ)medium for 8 weeks. ZN staining was performed from the growth obtained to confirm the diagnosis.

TABLE 1: PREPARATION OF LJ MEDIA

Potassium dihydrogen phosphate anhydrous (KH2PO4)	2.4 g
Magnesium sulphate (MgSO4. 7H2O)	0.24g
Magnesium citrate	0.6g
Asparagine	3.6g
Glycerol	12ml
Malachite green, 2% solution	20ml

The ingredients were dissolved in the same order in about 100 ml distilled water by heating. Glycerol and malachite green solutions were added and made up to 600 ml with distilled water. The mixture was autoclaved at 121^{O}C for 30 minutes and later cooled to room temperature. 24 hen's eggs were taken and cleaned with methylated spirit. Around 500 ml egg fluid was taken, homogenized and filtered through sterile gauze. Filtration of another 500 ml egg solution was then repeated and transferred to a round bottom flask. 600 ml of mineral salt solution was then added to the egg fluid. It was mixed thoroughly by gentle agitation for 5 minutes till uniform pale green colour obtained. The media was poured into McCartney bottles and sloped on the inspissator racks and kept at 85^{O}C for 1 hour.

FUNGAL CULTURE- Samples were cultured on two sets of Sabourauds dextrose agar (with and without cycloheximide)(SDA) and incubated at 25°C and 37° C for two days. Identification of the isolates was done by Gram staining, germ tube testing and lactophenol cotton blue mount. Identification and susceptibility of yeast isolates was done by Vitek 2 System.

TABLE 2: COMPOSITION OF SDA

Peptone	10gm
Dextrose	40gm
Agar	20gm
Distilled water	1000ml

After mixing the above ingredients, adjust the pH to 5.6. Sterilize(autoclave)the medium at 121°C at 15 PSI for 15 minutes. After cooling, the medium is poured into sterile test tubes. These tubes are

now cooled at an angle to form slant agar. When the medium has solidified and cooled at room temperature, it is ready for inoculation and stored in the refrigerator for future use.

TABLE 3: COMPOSITION OF LACTOPHENOL COTTON BLUE STAIN

Melted phenol	20ml
Lactic acid	20ml
Glycerol	40ml
Cotton Blue	0.05gm
Distilled water	20ml

Mix all the reagents properly and dissolve 0.05gm of aniline dye(cotton blue) in distilled water before mixing with the remaining reagents. The phenol acts as a disinfectant, lactic acid preserves fungal morphology and glycerol is hygroscopic agent thereby preventing drying. The cotton blue stains the outer wall of the fungus.

SEROLOGICAL TESTS: Request received for anti-HAV/HBsAg/anti-HCV/anti-HEV/anti -HIV/Dengue NS1 antigen/Dengue IgM /Leptospira IgM/Scrub typhus IgM/Chikungunya IgM/Typhiwell/Widal/Brucella agglutination test/ Malaria antigen received in the department was processed as per manufacturer's instructions.

MOLECULAR TESTS : Requests received for Cartridge Based Nucleic Acid Amplification Test(CBNAAT)/Line Probe Assay(LPA)/ Biofire Filmarray Multiplex PCR/HBV DNA/HCV RNA PCR) was done as per kit protocol.

CHARACTERIZATION OF INFECTIONS

- Bacterial/Parasitic/Fungal/Viral Infections.
- Respiratory/Urinary/Blood/Body Fluids/Surgical Site Infection-Infection rate will be calculated depending upon the number of patients who developed the infection.
- Hospital-acquired (HA)/Community-acquired(CA)Infections
  - ✓ HA(Infections that occurred 48 hours after hospital admission)
  - ✓ CA(Infections occurring <48 hours after hospital admission)[78]
- Monomicrobial /Polymicrobial Infections.

- ✓ Monomicrobial(It is defined as the isolation of one pathogen from the same sample)
- ✓ Polymicrobial(if two or more pathogens were isolated from cultures of samples obtained within 48 h after the initial evaluation, irrespective of whether the isolate came from the same or different culture bottle)

- Device associated infection rate (VAP, CLABSI, CAUTI)-calculated depending upon the number of days of indwelling device.

OUTCOME: Patient discharged / death

STATISTICAL ANALYSIS

Data will be described in terms of range; mean ± standard deviations (±SD) frequencies (number of cases) and relative frequencies (%age) as appropriate. All statistical calculations will be done using SPSS (statistical package for the social sciences). SPSS 21 version statistical program for Microsoft windows.

OBSERVATION AND RESULTS

This prospective study was conducted in the Department of Microbiology, Dayanand Medical College and Hospital, Ludhiana, over a period of one year. During this period, 1010 patients were admitted in Surgical ICU and infections were present in 345 patients (34.2%). Four patients (0.4%) had pulmonary tuberculosis, 48 patients (4.8%) had viral infections, 7 patients (0.7%) had fungal infection, 311 patients (30.8%) had bacterial infections.

On the basis of clinical suspicion, various samples (respiratory, urine, blood, body fluid, soft tissue) were collected and processed as per standard protocol. Out of the 311 patients, 376 bacterial infections were identified, among which 225 infections were community acquired and 151 were hospital acquired. A total of 420 isolates (83.8% Gram negative and 16.2% Gram positive) were obtained. These isolates were further processed and identified. The antibiogram of these isolates were studied. Following observations and results were made from the study. All the results are depicted in form of charts and graphs and statistical analysis was done.

TABLE 4: AGE WISE DISTRIBUTION OF ADMITTED PATIENTS (n=1010)

Age group	Number (%)
< 20	43(4.3)
21-30	145(14.4)
31-40	148(14.7)
41-50	136(13.5)
51-60	175(17.3)
61-70	206(20.4)
71-80	117(11.6)
81-90	40(4)
Total	1010(100)

Maximum admitted patients were from the age group of 61-70 years followed by 51-60 years. Mean age of admitted patients = 51.08, standard deviation=18.43.

TABLE 5: SEX WISE DISTRIBUTION OF ADMITTED PATIENTS (n=1010)

Sex	Number(%)
Females	298(29.5)
Males	712(70.5)
Total	1010(100)

Majority of patients were males (70.5 %) as compared to females (29.5%)

TABLE 6: REASON OF ADMISSION TO SURGICAL ICU (n=1010)

Diagnosis	Number of patients (%)
Road side accident(RSA)/ Polytrauma	283(28)
Intestinal Obstruction/ GI Bleed	179(17.7)
GI Perforation	59(5.8)
Diabetic Foot/ Gangrene	50(5)
Abscess/ Cellulitis	49(4.9)
Pancreatitis	131(13)
Cholelithiasis / Cholecystitis	75(7.4)
Carcinoma	50(4.9)
Pneumothorax/ Hemothorax	37(3.7)
Hernia	26(2.6)
Appendicitis	14(1.4)
Others	57(5.6)

Majority of patients were admitted as a result of RSA/ Polytrauma(28%)

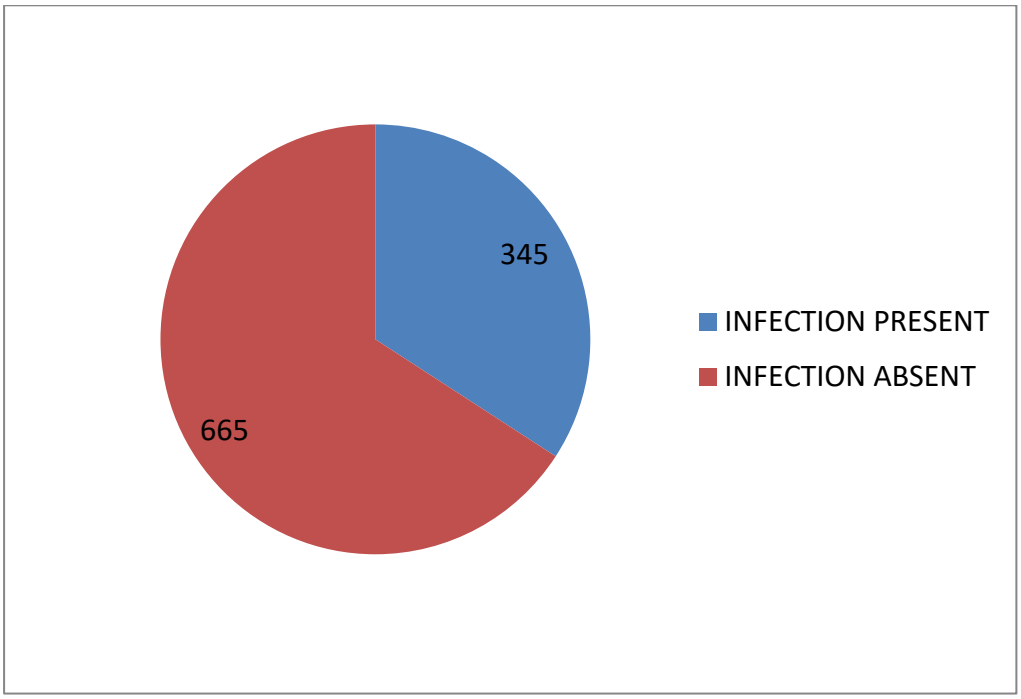
Mean APACHE score of admitted patients was 14.8.

TABLE 7: MEAN ICU STAY OF ADMITTED PATIENTS (n=1010)

Number of days	Number (%)
0-7	780(77.2)
8-14	178(17.6)
15-21	40(4)
> 21	12(1.2)

Majority of patients had ICU stay upto 7 days (Mean=5.4)

FIGURE 1: PATIENTS WITH AND WITHOUT INFECTION (n=1010)



Out of 1010 patients admitted, infections were present in 345 patients with an infection rate of 34.2%.

TABLE 8: AGE WISE DISTRIBUTION OF PATIENTS WITH INFECTIONS (n=345)

Age	Number (%)
< 20	15(4.3)
21-30	46(13.3)
31-40	51(14.8)
41-50	48(13.9)
51-60	61(17.7)
61-70	70(20.3)
71-80	43(12.5)
81-90	11(3.2)
Total	345(100)

Majority of patients were in the age group of 61-70 years followed by 51-60 years. Mean age was 51.33 and standard deviation was 18.

TABLE 9: SEX WISE DISTRIBUTION OF PATIENTS WITH INFECTIONS (n= 345)

Sex	Number (%)
Females	91(26.4)
Males	254(73.6)
Total	345(100)

Majority of patients were males (73.6%) as compared to females (26.4%)

TABLE 10: COMORBIDITIES OF PATIENTS WITH INFECTIONS (n=345)

Comorbidity	Number(%)
Diabetes mellitus	109(31.6)
Hypertension	79(22.9)
Chronic kidney disease	19(5.5)
Cancer	15(4.3)
Past Tuberculosis	10(2.9)
Pulmonary	10(2.9.)
Coronary artery disease	7(2)

Out of 345 patients, 249 were having comorbidities and no comorbidity was observed in 96(27.8%) cases. Majority of patients were Diabetic (31.6%)

TABLE 11: RISK FACTORS OF PATIENTS WITH INFECTIONS (n=345)

Risk factors	Number (%)
Sepsis	109(31.5)
Alcoholic	63(8.4)
Elderly	54(15.7)
Immobilisation	50(20.6)
Smoking	25(7.2)
Immunocompromised	15(4.3)

Most common risk factor was sepsis observed in 31.5% patients and no risk factor was observed in 8.9% patients.

TABLE 12: REASON FOR ADMISSION OF PATIENTS WITH INFECTIONS (n=345)

Diagnosis	Number(%)
Road side accident (RSA)/ Polytrauma	69(20)
Intestinal Obstruction/ GI Bleed	63(18.3)
Pancreatitis	55(16)
GI Perforation	33(9.6)
Diabetic Foot/ Gangrene	27(7.8)
Abscess/ Cellulitis	24(7)
Cholelithiasis/ Cholecystitis	21(6.1)
Carcinoma	15(4.3)
Pneumothorax/Hemothorax	13(3.8)
Hernia	6(1.7)
Appendicitis	5(1.4)
Others	14(4)

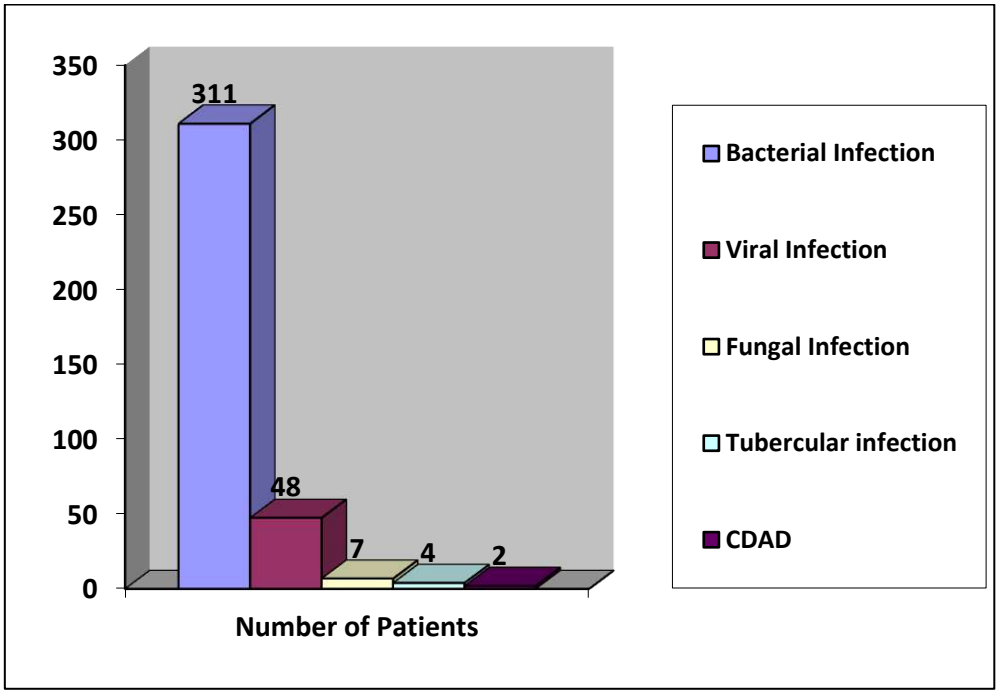
Majority of patients with infections were admitted as a result of RSA/ Polytrauma.
Mean APACHE score of patients with infections was 14.86.

Table 13: CHARACTERIZATION OF INFECTIONS ACCORDING TO AETIOLOGY (n=345)

Type of Infection	Number
Bacterial	287
Viral	32
Tubercular	2
Bacterial + fungal	6
Bacterial + viral	15
Bacterial + tubercular	2
Bacterial + fungal + viral	1
Total	345

Out of 1010 patients admitted, infections were present in 345 patients. 287 patients had only bacterial infection (2 patients with bacterial infection had *Clostridium difficile* infection) and 24 patients had bacterial infection with viral/fungal/tubercular infection, thus a total of 311 patients with bacterial infections were observed. 7 patients had fungal infection (6 patients had fungal and bacterial infection and 1 patient had bacterial, fungal and viral infections). 48 patients had viral infections (33 patients had only viral, 14 patients had viral and bacterial infection and 1 patient had viral, bacterial and fungal infection); 4 patients had tuberculosis(2 patients had both tubercular and bacterial infection and 2 patients had only tubercular infection).

FIGURE 2: CHARACTERIZATION OF INFECTIONS ACCORDING TO AETIOLOGY

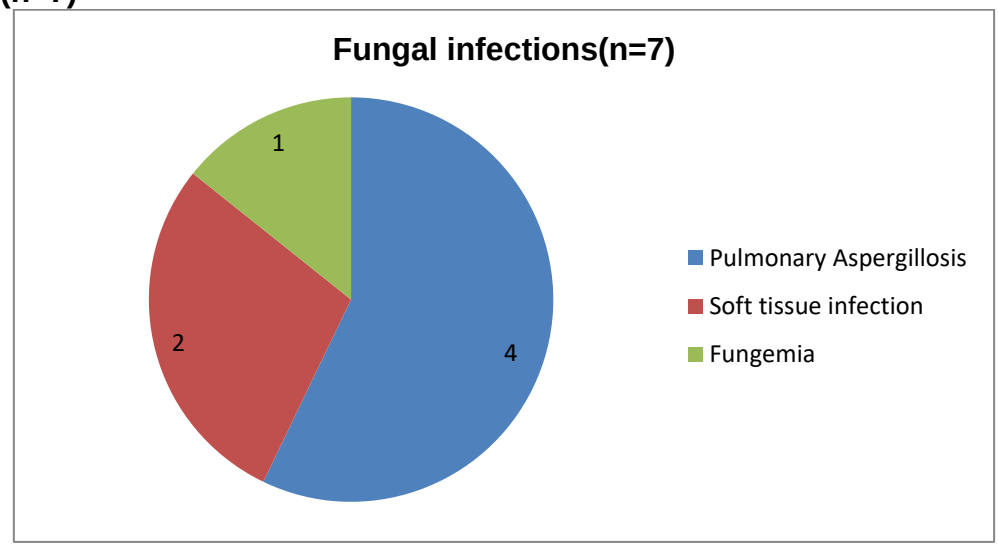


CDAD-*Clostridium Difficile* Associated Diarrhea

CHARACTERIZATION OF MYCOBACTERIAL INFECTIONS:

4 patients had mycobacterial infection, out of which 2 patients had pulmonary and 2 patients had extrapulmonary tuberculosis. All 4 cases were sensitive to Isoniazid and rifampicin resistance was not detected.

FIGURE 3: CHARACTERIZATION OF FUNGAL INFECTIONS (n=7)



4 patients had Pulmonary Aspergillosis (*Aspergillus flavus* in each), 2 patients had soft tissue infections(*Aspergillus fumigatus* and *Candida tropicalis*) and 1 patient had candidemia.

TABLE 14: ANTIFUNGAL SUSCEPTIBILITY PATTERN OF *ASPERGILLUS* ISOLATES (n=5)

Antifungal Agents	Number (%)
Voriconazole	2(40)
Itraconazole	5(100)
Posaconazole	4(100)*
Amphotericin B	5(100)
Caspofungin	0(0)

***A. fumigatus* is intrinsically resistant to posaconazole, hence not included on antifungal susceptibility testing.

Candida spp was 100% susceptible to fluconazole, micafungin and amphotericin B and 50% susceptible to voriconazole and caspofungin.

TABLE 15: CHARACTERIZATION OF VIRAL INFECTIONS (n=48)

Viral infections	Number
Hepatitis A infection	2
Hepatitis B infection	7
Hepatitis C infection	29
Hepatitis B +C coinfection	1
Dengue infection	8
Influenza A infection	1
Total	48

CHARACTERIZATION OF BACTERIAL INFECTIONS (n=311)

TABLE 16: PATIENTS WITH SINGLE SITE / MULTIPLE SITE INFECTIONS (n=311)

Site	Number
Multiple site	61
Single site	250
Total	311

250 patients had infection at single site and 61 patients had infection at multiple sites.

TABLE 17: DETAILS OF SINGLE SITE INFECTIONS (n=250)

Type of infections	Number of infections
Body fluid infection(BFI)	68
Blood stream infection(BSI)	18
Respiratory tract infection(RTI)	53
Urinary tract infection(UTI)	19
Skin and soft tissue infection(SSTI)	92
TOTAL	250

TABLE 18: DETAILS OF MULTIPLE SITE INFECTIONS (n=126)

Type of infections	Number of patients	Number of infections
BFI+BSI	7	14
BFI+RTI	7	14
BFI+SSTI	6	12
BFI+UTI	3	6
BSI+RTI	6	12
BSI+SSTI	7	14
RTI+BSI	1	2
RTI+SSTI	8	16
RTI+UTI	4	8
SSTI+BFI	1	2
UTI+BSI	3	6
UTI+SSTI	4	8
BFI+SSTI+RTI	1	3
BFI+SSTI+UTI	1	3
BSI+RTI+SSTI	2	6
Total	61	126

Among 310 patients, 250 had single site infection, 61 had infection at multiple sites (126), thus a total of 376 infections were observed.

TABLE 19: CHARACTERIZATION OF BACTERIAL INFECTIONS (n=376)

Type	Number (%)
BFI	94(25)
BSI	44(11.7)
RTI	82(21.8)
SSTI	122(32.4)
UTI	34(9)
Total	376(100)

Most common type of infections were skin and soft tissue infections (32.4 %) followed by body fluid infection (25%)

FIGURE 4: CHARACTERIZATION OF BACTERIAL INFECTIONS (n=376)

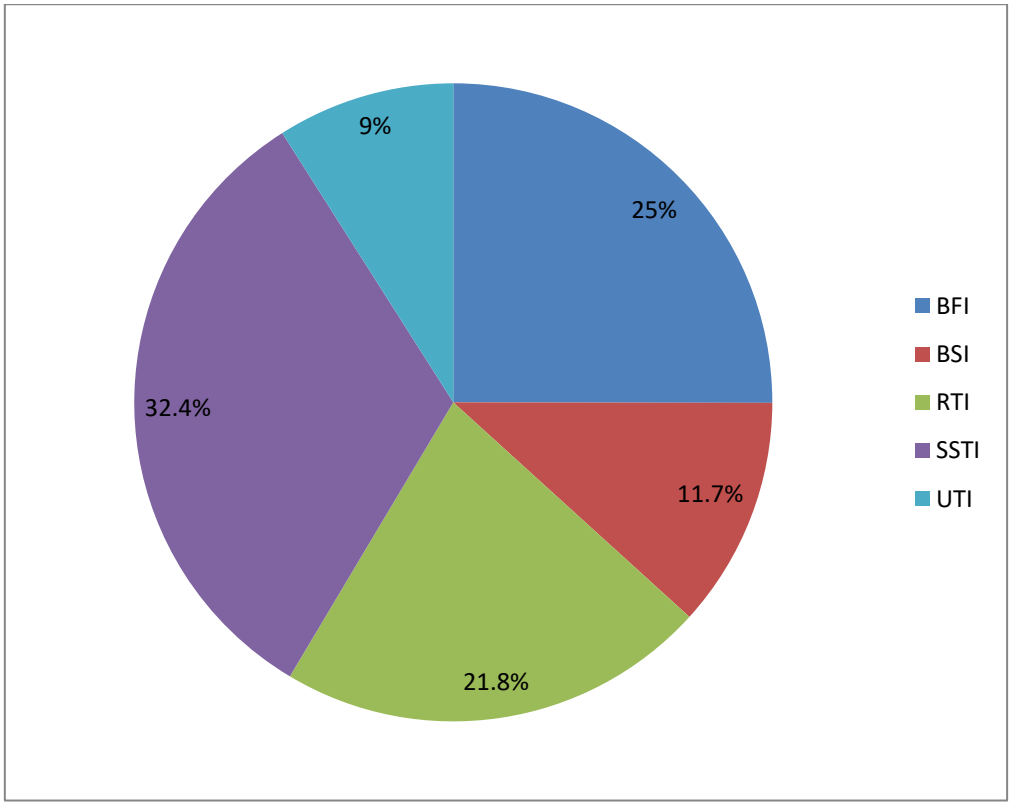


TABLE 20: DISTRIBUTION OF MONOMICROBIAL VS POLYMICROBIAL INFECTIONS (n=376)

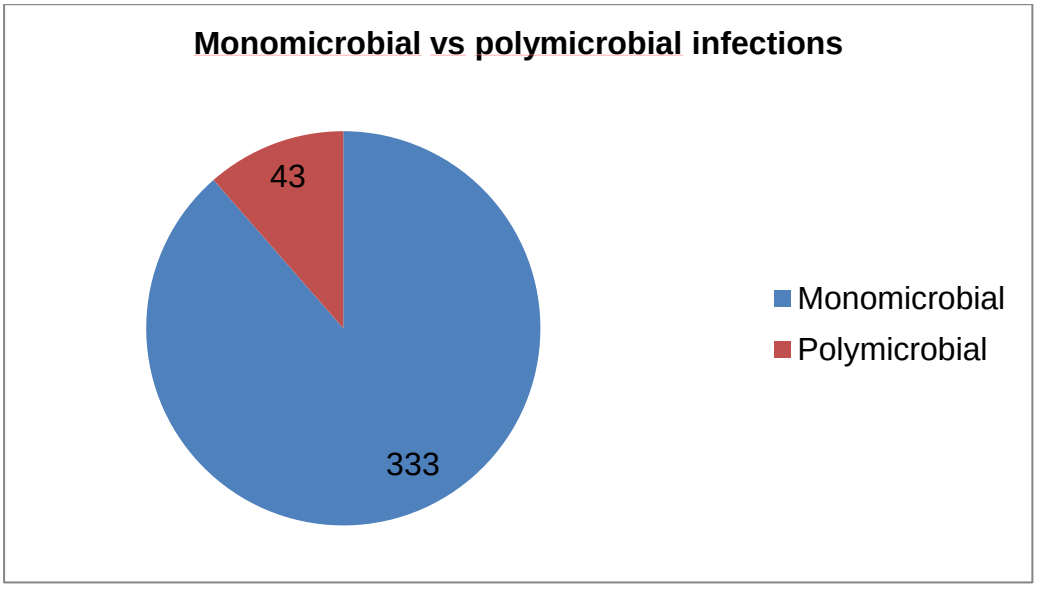
Type of infections	Monomicrobial	Polymicrobial	Total
BFI	88(93.6%)	6(6.4%)	94
BSI	44(100%)	0(0%)	44
RTI	72(87.8%)	10(12.2%)	82
SSTI	96(78.7%)	26(21.3%)	122
UTI	33(97%)	1(3%)	34
Total	333	43	376

Skin and soft tissue infections had maximum number of polymicrobial infections.

FIGURE 5: MONOMICROBIAL VS POLYMICROBIAL INFECTIONS (n=376)



Out of 376 infections, 333 infections had monomicrobial growth whereas in 43 infections polymicrobial (2 isolates in 42 infections and 3 isolates in 1 infection) growth was obtained. Thus a total of 420 isolates were obtained.

TABLE 21: CHARACTERIZATION OF ISOLATES (n=420)

Isolates	Total number	Percentage
Gram negative	352	83.8%
Gram positive	68	16.2%
Total	420	100%

Majority of isolates were Gram negative (83.8%) as compared to Gram positive (16.2%)

FIGURE 6: CHARACTERIZATION OF ISOLATES (n=420)

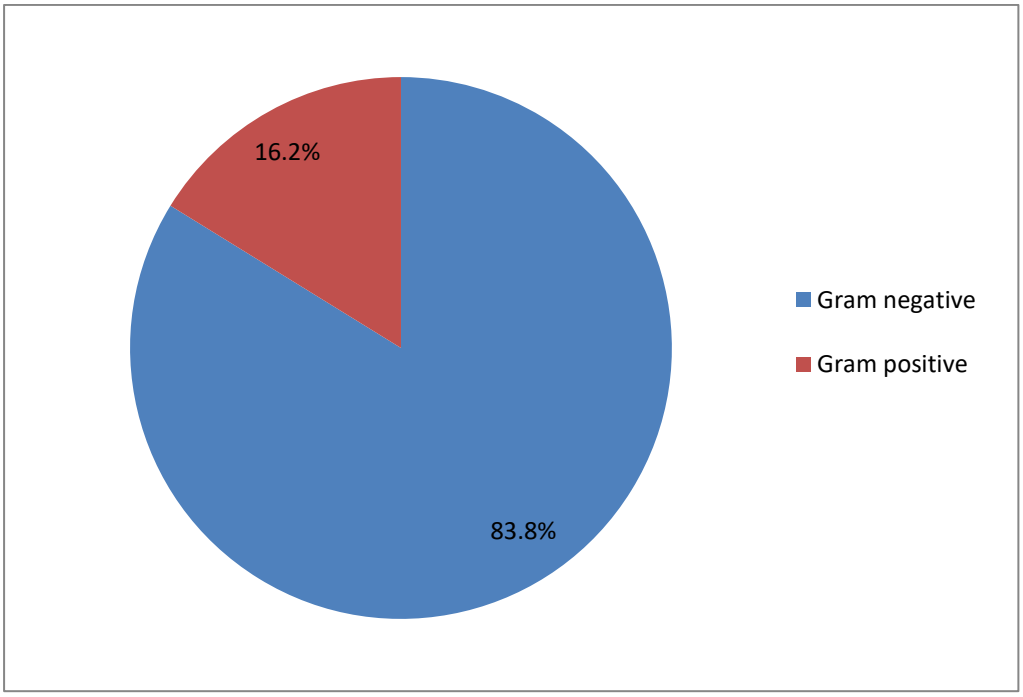


TABLE 22: DISTRIBUTION OF ISOLATES (n=420)

Isolate	Number(%)
Gram negative isolates(n=352)	
Escherichia coli	125(29.8)
Klebsiella pneumoniae	110(26.2)
Acinetobacter baumannii	56(13.3)
Pseudomonas aeruginosa	27(6.4)
Enterobacter aerogenes	7(1.7)
Enterobacter cloacae	5(1.2)
Proteus mirabilis	4(1)
Citrobacter freundii	3(0.7)
Morganella morganii	2(0.5)
Providentia retgeri	2(0.5)
Serratia marcescens	2(0.5)
Sphingomonas paucimobilis	2(0.5)
Burkholderia cepacia	1(0.2)
Klebsiella oxytoca	1(0.2)
Klebsiella ozaenae	1(0.2)
Myroides spp	1(0.2)
Pseudomonas luteola	1(0.2)
Serratia liquefaciens	1(0.2)
Stenotrophomonas maltophilia	1(0.2)
Gram positive isolates(n=68)	
Enterococcus faecium	16(3.8)
Staphylococcus haemolyticus	16(3.8)
Staphylococcus aureus	15(3.6)
Enterococcus faecalis	9(2.1)
Enterococcus gallinarum	5(1.2)
Staphylococcus epidermidis	4(1)
Staphylococcus saprophyticus	1(0.2)
Staphylococcus hominis	1(0.2)
Streptococcus agalactiae	1(0.2)
Total	420(100)

In Gram negative isolates, *Escherichia coli* (29.8%) was most common followed by *Klebsiella pneumoniae*(26.2%)

In Gram positive isolates, *Enterococcus faecium (*3.8%) *and Staphylococcus haemolyticus (*3.8%) were most common followed by *Staphylococcus aureus (3.6%)*

FIGURE 7: DISTRIBUTION OF ISOLATES (n=420)

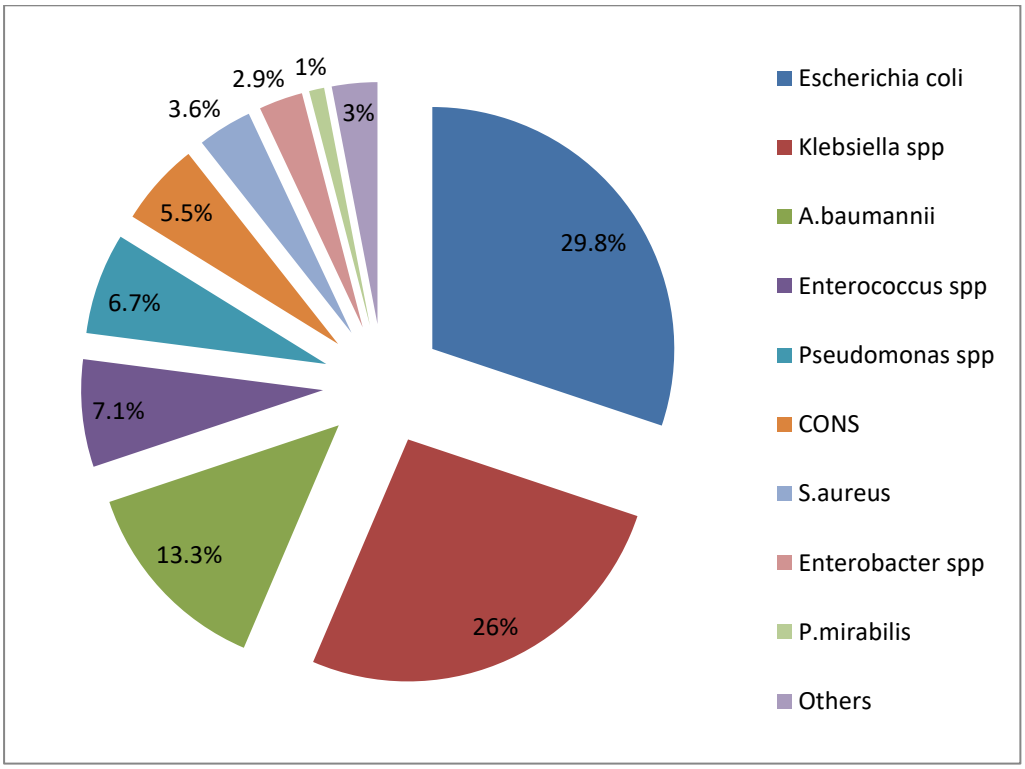

TABLE 23: SAMPLE WISE DISTRIBUTION OF ISOLATES (n=420)

Organism	Blood	Body fluid	Sputum	ET	Urine	Pus	Tissue	Wound swab	Total
Gram negative isolates									
Escherichia coli	*11*	43	3	8	10	25	19	6	125

Stenotrophomonas maltophilia	*1*	0	0	0	0	0	0	0	1
Gram positive isolates									
Enterococcus spp	*4*	9	0	1	4	6	4	2	30
CONS	*12*	6	0	0	0	0	4	0	22
Staphylococcus aureus	*1*	2	0	2	0	8	2	0	15
Streptococcus agalactiae	*0*	1	0	0	0	0	0	0	1
Total	46	98	14	78	35	55	67	25	420

The organism observed in respiratory samples was *Acinetobacter baumannii* ,while *Escherichia coli* was the predominant isolate observed in blood, body fluid, urine and skin and soft tissue samples.

TABLE 24: ANTIMICROBIAL SUSCEPTIBILITY PATTERN OF GRAM NEGATIVE ISOLATES (n=352)

Drugs	Number(%)
Amikacin	195(55.4)
Cotrimoxazole	80(22.7)
Tetracycline	28(7.9)
Minocycline	44(12.5)
Cefuroxime	17(4.8)
Cefepime	49(13.9)
Ceftriaxone	13(3.7)
Ceftazidime	18(5.1)
Ciprofloxacin	28(7.9)
Pipercillin+ Tazobactam	65(18.5)
Cefoperazone+ Sulbactam	122(34.6)
Amoxicillin+Clavulanic acid	44(12.5)
Imipenem	101(28.7)
Ertepenem	73(20.7)
Meropenem	89(25.3)
Colistin	297(84.4)
Tigecycline	160(45.5)

Gram negative isolates showed low susceptibility to ceftriaxone (3.7%), ceftazidime (5.1%), while isolates were highly susceptible to amikacin (55.4%) and tigecycline (45.5%)

FIGURE 8: ANTIMICROBIAL SUSCEPTIBILITY PATTERN OF GRAM NEGATIVE ISOLATES (n=352)

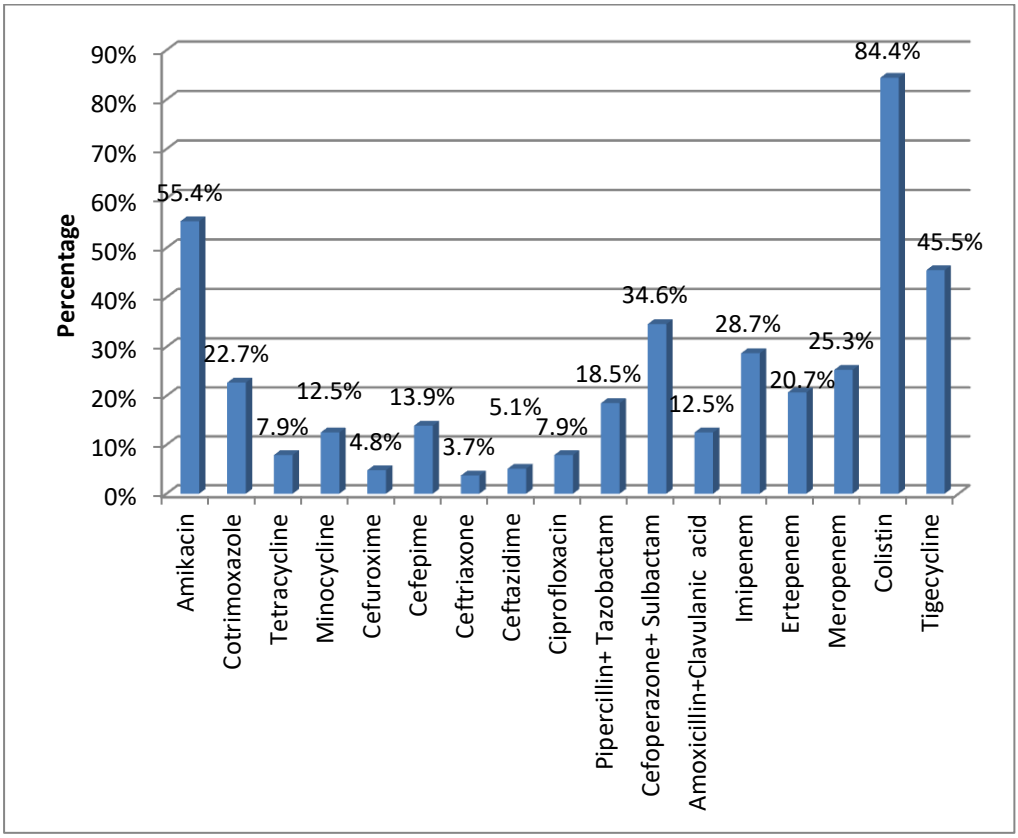

TABLE 25: ANTIMICROBIAL SUSCEPTIBILITY PATTERN OF GRAM POSITIVE ISOLATES (n=68)

Drugs	Number (%)
Penicillin	8(11.8)
Gentamicin/HLG*	26(38.2)
Ciprofloxacin	7(10.3)
Levofloxacin	6(8.8)
Clindamycin	14(20.6)
Erythromycin	12(17.6)
Daptomycin	15(22)
Tetracycline	10(14.7)
Cotrimoxazole	17(25)
Teicoplanin	58(85.3)
Vancomycin	53(77.9)
Linezolid	64(94.1)

*HLG-High Level Gentamicin

Gram positive isolates showed low susceptibility to levofloxacin (8.8%), ciprofloxacin (10.3%) and penicillin (11.8%).High sensitivity was seen for linezolid (94.1%), teicoplanin (85.3%), vancomycin (77.9%)

FIGURE 9: ANTIMICROBIAL SUSCEPTIBILITY PATTERN OF GRAM POSITIVE ISOLATES (n=68)

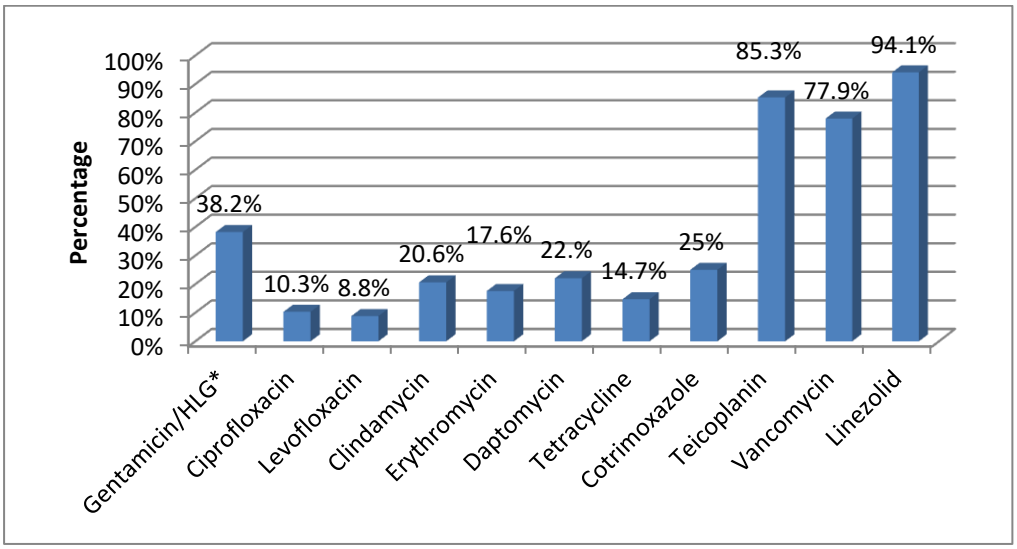

TABLE 26: CHARACTERIZATION OF ISOLATES INTO MDR/XDR/PDR (n=420)

MDR/XDR/PDR	Number (%)
MDR	350(83.3)
XDR	279(66.4)
PDR	-

Out of 420 bacterial isolates, 350 (83.3%) were multidrug resistant, 279 (66.4%) were extensively drug resistant.

TABLE 27: CHARACTERIZATION OF GRAM NEGATIVE AND GRAM POSITIVE ISOLATES INTO MDR/XDR/PDR

Number of MDR/XDR/PDR	Gram negative isolates (n=352)	Gram positive isolates (n=68)
MDR	304(86.4%)	46(67.6%)
XDR	257(73%)	22(32.4%)
PDR	-	-

Out of 352 Gram negative isolates, 304(86.4%) were multidrug resistant and 257(73%) were extensively drug resistant.

Out of 68 Gram positive isolates, 46(67.6%) were multidrug resistant and 22(32.4%) were extensively drug resistant.

FIGURE 10: CHARACTERIZATION OF GRAM NEGATIVE AND GRAM POSITIVE ISOLATES INTO MDR/XDR/PDR

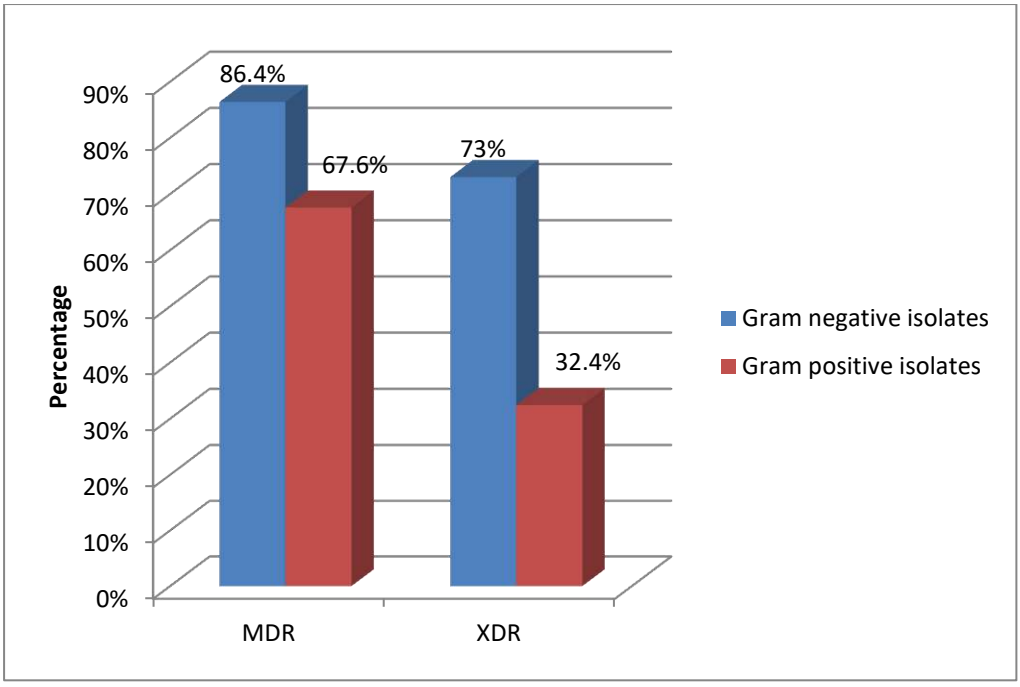

TABLE 28: DISTRIBUTION OF MRSA/VRE/MRCONS

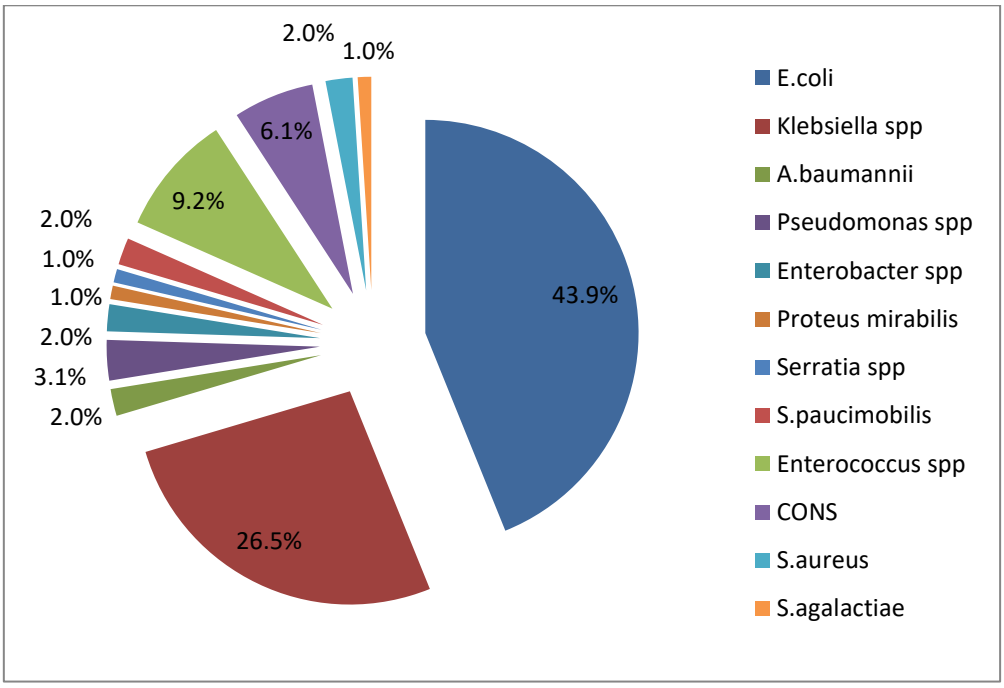
Isolates	Resistance pattern	n(%)
S.aureus(n=15)	MRSA	2(13.3)
Enterococcus spp(n=30)	VRE	7(23.3)
CONS(n=22)	MRCONS	7(31.8)

Out of 15 isolates of *S.aureus*, 13.3% were methicillin resistant (MRSA).

Out of 30 isolates of *Enterococcus* spp, 23.3% were VRE.

Out of 22 isolates of CONS, 31.8% were MRCONS

FIGURE 11: DISTRIBUTION OF BODY FLUID ISOLATES (n=98)



Most common organism causing body fluid infection was *E.coli* (43.9%) followed by *Klebsiella spp*.(26.5%)

TABLE 29: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE BODY FLUID ISOLATES.

Antibiotics	*E.coli* (n=43)	*Klebsiella spp* (n=26)	*Pseudomonas spp* (n=3)
Amikacin	35(81.4%)	15(57.7%)	2(66.7%)
Cotrimoxazole	11(25.6%)	8(30.8%)	0(0%)
Tetracycline	0(0%)	7(26.9%)	0(0%)
Minocycline	0(0%)	0(0%)	0(0%)
Cefuroxime	4(9.3%)	2(7.7%)	0(0%)
Cefepime	8(18.6%)	2(7.7%)	1(33.3%)
Ceftriaxone /Ceftazidime	4(9.3%)	1(3.8%)	0(0%)
Ciprofloxacin	1(2.3%)	1(3.8%)	0(0%)
Piperacillin+tazbactam	13(30.2%)	3(11.5%)	0(0%)
Cefoperazone+Sulbactam	17(39.5%)	6(23.1%)	0(0%)
Amxoxicillin+Clavulanic acid	8(18.6%)	6(23.1%)	0(0%)
Imipenem	17(39.5%)	3(11.5%)	1(33.3%)
Ertapenem	14(32.6%)	4(15.4%)	0(0%)
Meropenem	17(39.5%)	3(11.5%)	1(33.3%)
Colistin	41(95.3%)	24(92.3%)	3(100%)
Tigecycline	34(70.1%)	14(53.8%)	0(0%)

E.coli showed maximum sensitivity for amikacin (81.4%) followed by tigecycline(70.1%).*Klebsiella spp* showed maximum sensitivity for amikacin (57.7%) followed by tigecycline(53.8%).

FIGURE 12: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE BODY FLUID ISOLATES.

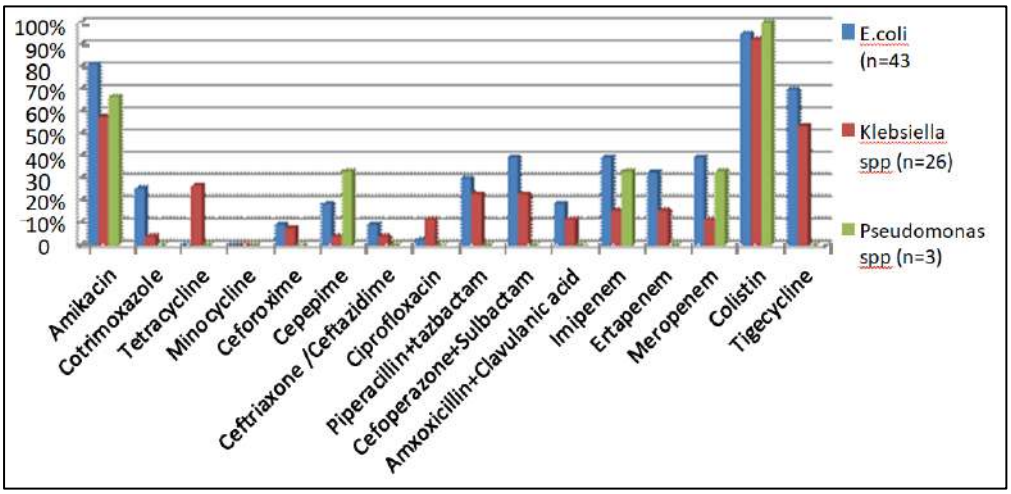


TABLE 30: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM POSITIVE BODY FLUID ISOLATES

Antibiotics	***Enterococcus spp*** **(n=9)**	***CONS*** **(n=6)**
Penicillin	0(0%)	1(16.7%)
Gentamicin	3(33.3%)	1(16.7%)
Cotrimoxazole	0(0%)	2(33.3%)
Tetracycline	3(33.3%)	2(33.3%)
Ciprofloxacin	4(44.4%)	1(16.7%)
Levofloxacin	4(44.4%)	1(16.7%)
Clindamycin	0(0%)	1(16.7%)
Erythromycin	4(44.4%)	1(16.7%)
Daptomycin	0(0%)	2(33.3%)
Teicoplanin	7(77.8%)	6(100%)
Vancomycin	7(77.8%)	6(100%)
Linezolid	8(88.9%)	6(100%)

Enterococcus spp showed maximum sensitivity to linezolid(88.9%) followed by teicoplanin and vancomycin (77.7% each)

All Enterococcus spp were sensitive to teicoplanin, vancomycin and linezolid(100%)

FIGURE 13: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM POSITIVE BODY FLUID ISOLATES.

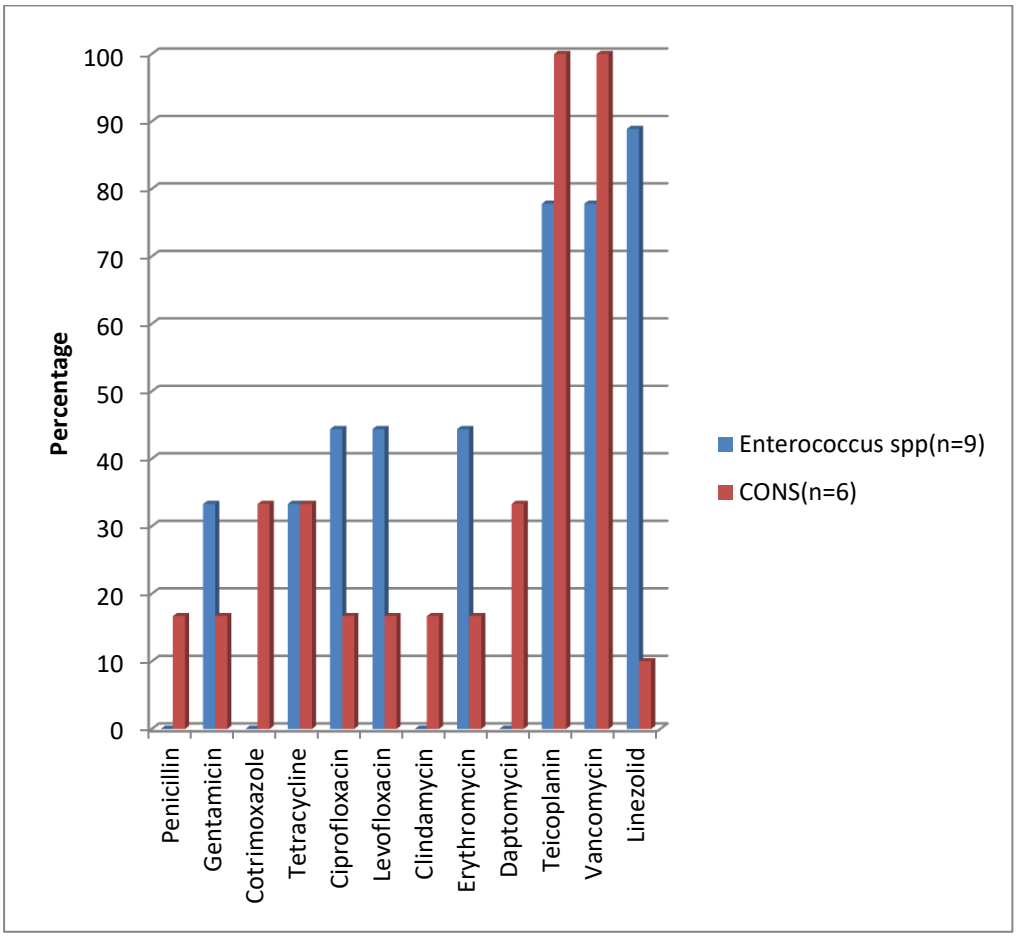

FIGURE 14: DISTRIBUTION OF BLOOD ISOLATES(n=46)

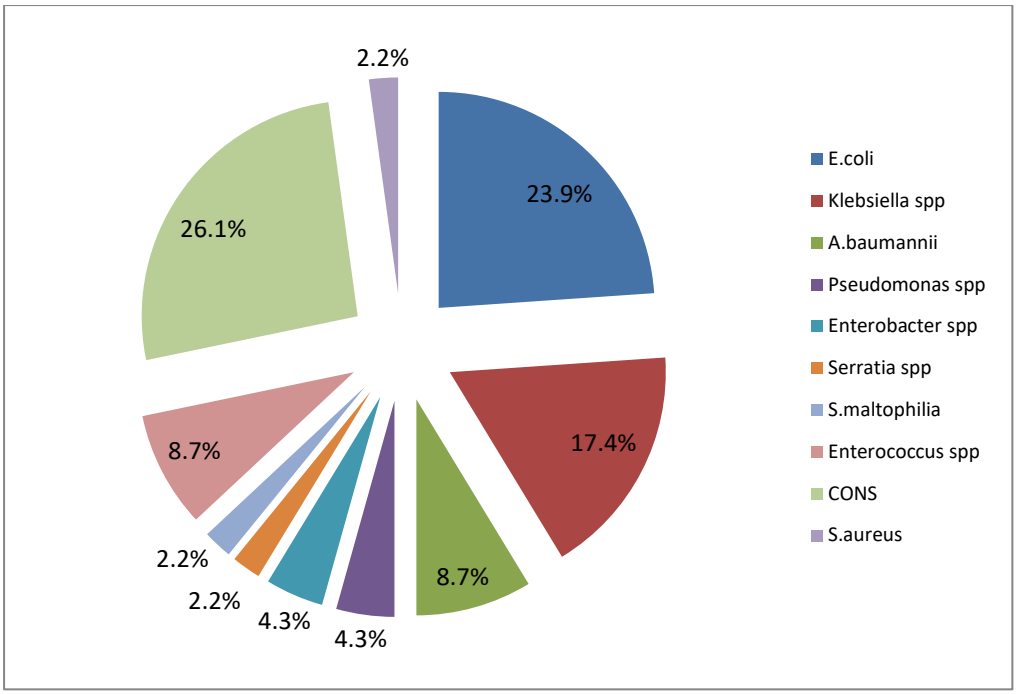

Most common organism causing blood stream infection was *E.coli*(23.9%) followed by *Klebsiella spp*.(17.4%)

TABLE 31: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE BLOOD ISOLATES.

Antibiotics	***E.coli*** **(n=11)**	***Klebsiella spp*** **(n=8)**	***A.baumannii*** **(n=4)**
Amikacin	8(72.7%)	3(37.5%)	1(25%)
Cotrimoxazole	1(9%)	0(0%)	1(25%)
Tetracycline	0(0%)	2(25%)	0(0%)
Minocycline	1(9%)	0(0%)	1(25%)
Cefuroxime	0(0%)	0(0%)	0(0%)
Cefepime	1(9%)	0(0%)	1(25%)
Ceftazidime/ceftriaxone	1(9%)	0(0%)	0(0%)
Ciprofloxacin	0(0%)	0(0%)	1(25%)
Piperacillin+Tazobactam	3(27.3%)	0(0%)	0(0%)
Cefoperazone+Sulbactam	6(54.5%)	1(12.5%)	0(0%)
Amoxicillin+Clavulanic acid	1(9%)	0(0%)	0(0%)
Imipenem	5(45.5%)	0(0%)	1(25%)
Ertapenem	6(54.5%)	0(0%)	0(0%)
Meropenem	6(54.5%)	0(0%)	1(25%)
Colistin	10(90.9%)	7(87.5%)	4(100%)
Tigecycline	1(9%)	1(12.5%)	0(0%)

E.coli showed maximum sensitivity for amikacin (72.7%)followed by imipenem, ertapenem ,meropenem and cefoperazone+sulbactam (54.5% each).*Klebsiella spp* showed maximum sensitivity for amikacin (37.5%) followed by tigecycline(12.5%).

FIGURE 15: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE BLOOD ISOLATES.

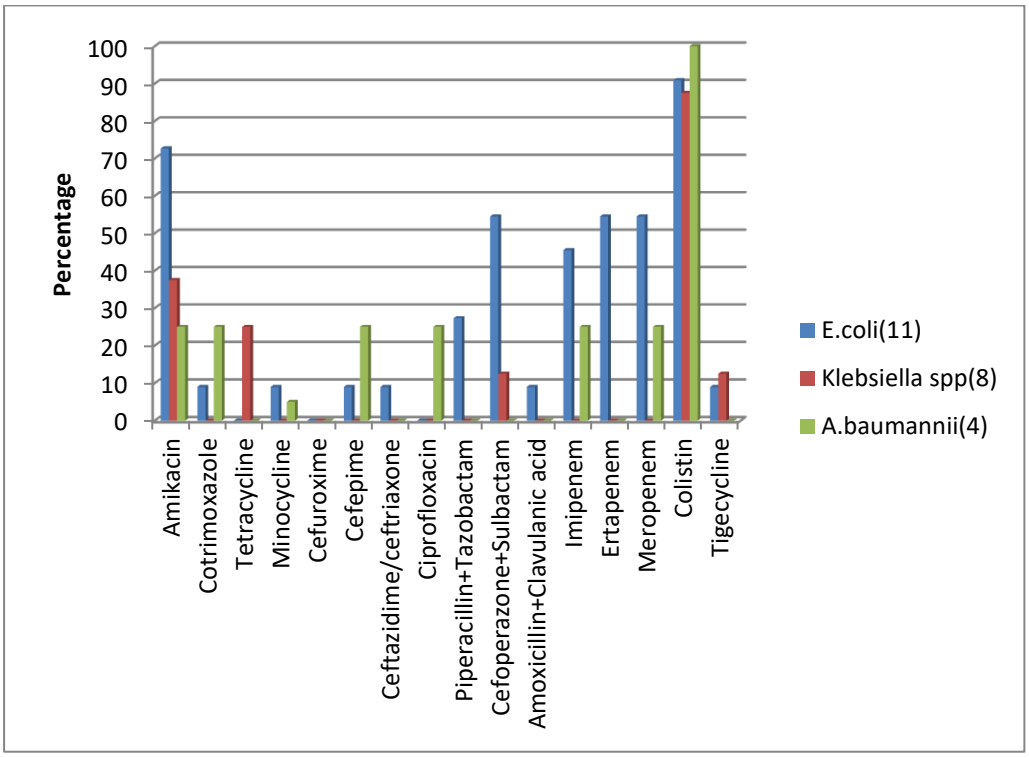

TABLE 32: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM POSITIVE BLOOD ISOLATES

Antibiotics	***CONS* (n=12)**	***Enterococcus spp.* (n=4)**
Penicillin	0(0%)	1(25%)
Ciprofloxacin	2(16.7%)	0(0%)
Levofloxacin	1(8.3%)	0(0%)
Daptomycin	6(50%)	0(0%)
Tetracycline	0(0%)	0(0%)
Cotrimoxazole	3(25%)	0(0%)
Clindamycin	4(33.3%)	0(0%)
Teicoplanin	12(100%)	4(100%)
Vancomycin	12(100%)	3(75%)
Linezolid	12(100%)	4(100%)

All *CONS* were sensitive tor teicoplanin, linezolid and vancomycin.Al *I* *Enterococcus spp* were sensitive for teicoplanin and linezolid.

FIGURE 16: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM POSITIVE BLOOD ISOLATES

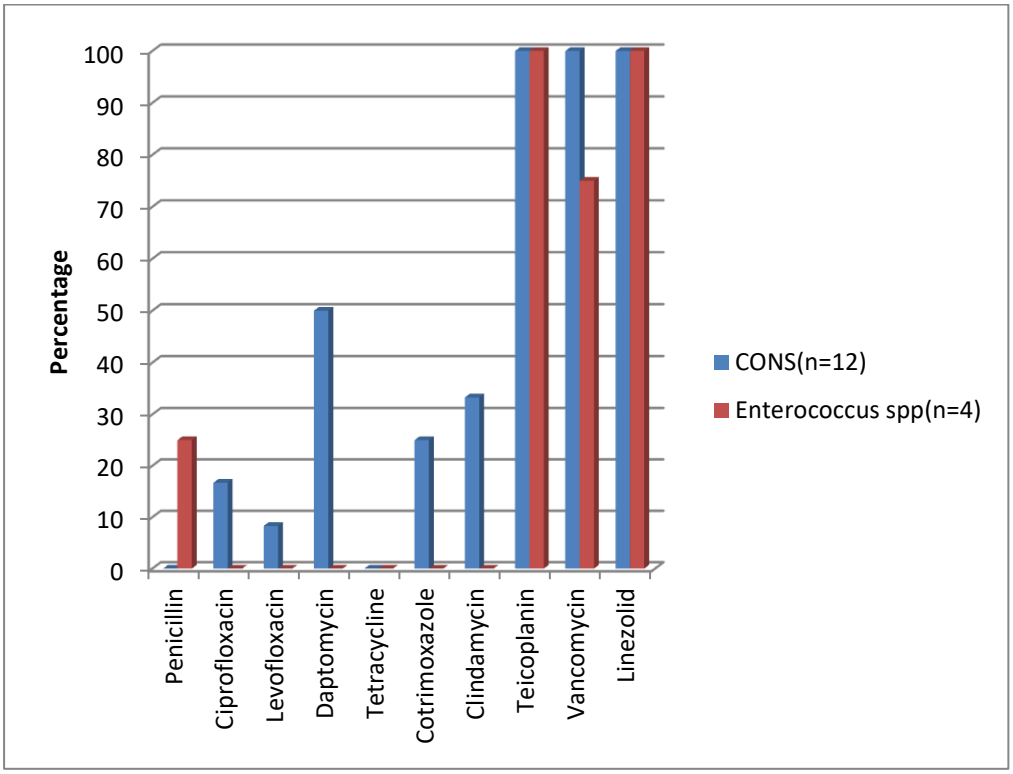

FIGURE 17: DISTRIBUTION OF RESPIRATORY ISOLATES (n=92)

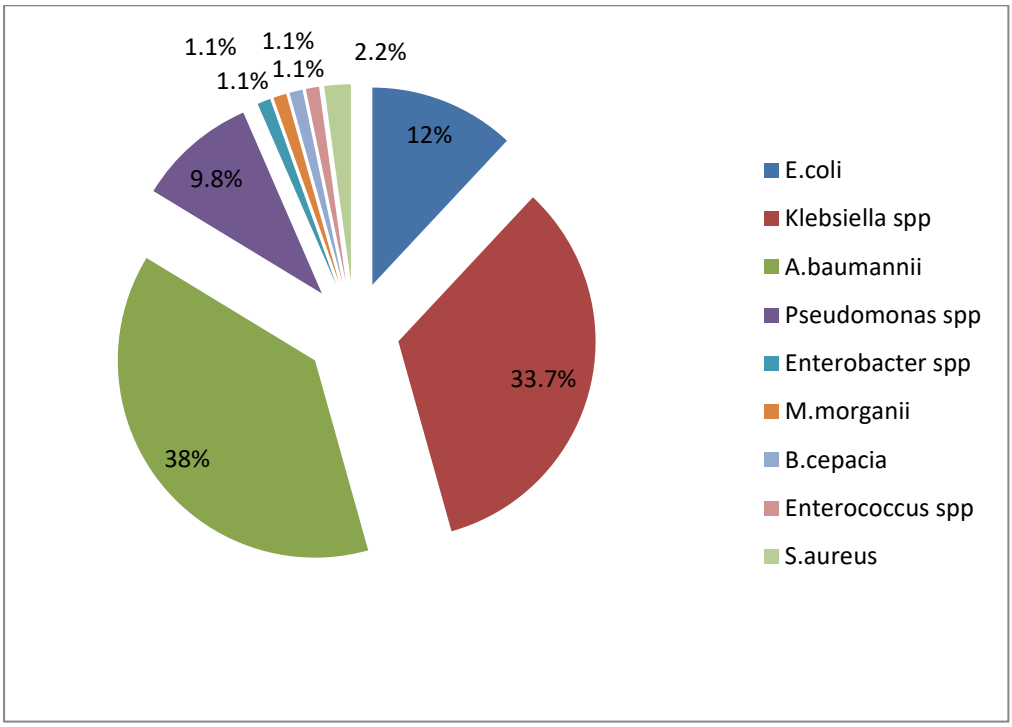

Most common organism causing respiratory tract infection was *A.baumannii(38%)* followed by *Klebsiella spp*.(33.7%)

TABLE 33: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE RESPIRATORY ISOLATES

Antibiotics	*A. baumanni* (n=35)	*Klebsiella spp.* (n=31)	*E. coli* (n=11)	*Pseudomonas spp.* (n=9)
Amikacin	4(11.4%)	21(67.7%)	8(72.7%)	3(33.3%)
Cotrimoxazole	5(14.3%)	8(25.8%)	4(36.4%)	1(11.1%)
Tetracycline	0(0%)	7(22.5%)	2(18.2%)	1(11.1%)
Minocycline	19(54.3%)	6(19.3%)	-	-
Cefepime	2(5.7%)	1(3.2%)	0(0%)	4(44.4%)
Ceftazidime/Cetriaxone	1(2.8%)	0(%)	0(0%)	2(22.2%)
Ciprofloxaxin	1(2.8%)	3(9.7%)	1(9%)	1(11.1%)
Piperacillin+Tazobactam	0(0%)	3(9.7%)	2(18.1%)	2(22.2%)
Cefoperazone + Sulbactam	11(31.4%)	3(9.7%)	3(27.3%)	3(33.3%)
Amoxicillin+Clavulanic acid	-	2(6.4%)	3(27.3%)	-
Imipenem	0(0%)	4(12.9%)	3(27.3%)	2(22.2%)
Ertapenem	-	2(6.4%)	4(36.4%)	-
Meropenem	0(0%)	4(12.9%)	4(36.4%)	2(22.2%)
Colistin	33(94.3%)	30(96.7%)	11(100%)	7(77.7%)
Tigecycline	0(0%)	17(54.8%)	10(90.9%)	1(11.1%)

Acinetobacter baumanni showed maximum sensitivity for minocycline (54.3%) followed by cefoperazone + sulbactam (31.4%). *Klebsiella spp* showed maximum sensitivity for amikacin (67.7%) followed by tigecycline (54.8%).

Only 3 Gram positive isolates were obtained among which *S. aureus* was sensitive to vancomycin, teicoplanin, daptomycin, and cotrimoxazole, while *Enterococcus spp.* was sensitive to vancomycin, linezolid and teicoplanin.

FIGURE 18: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE RESPIRATORY ISOLATES

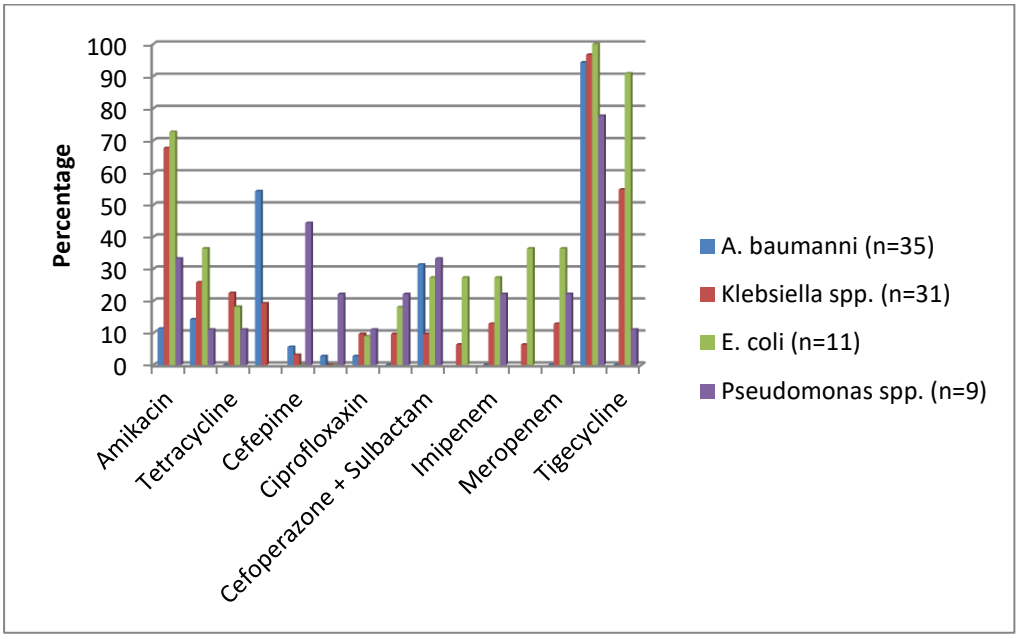

FIGURE 19: DISTRIBUTION OF URINARY ISOLATES (n=35)

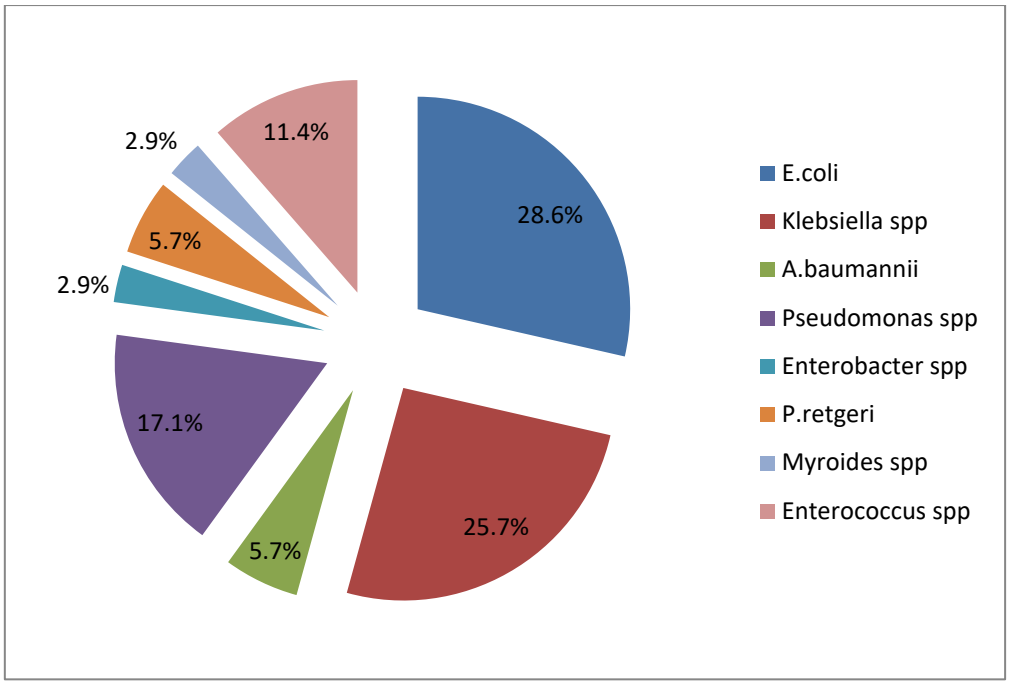

Most common organism causing urinary tract infection was *E.coli* (28.6%) followed by *Klebsiella spp*.(25.7%)

TABLE 34: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE URINARY ISOLATES

Antibiotics	*E. coli* (n=10)	*Klebsiella spp* (n=9)	*Pseudomonas spp.* (n=6)
Amikacin	7(70%)	0 (0%)	0(0%)
Cotrimoxazole	4(40%)	1(11.1%)	-
Tetracycline	2(20%)	2(22.2%)	0(0%)
Cefepime	1(10%)	0(0%)	0(0%)
Ceftazidime/ Ceftriaxone	2(20%)	0(0%)	1(16.6%)
Ciprofloxacin	1(10%)	0(0%)	1(16.6%)
Piperacillin+Tazobactam	4(40%)	0(0%)	0(0%)
Cefoperazone+Sulbactam	6(60%)	2(22.2%)	2(33.3%)
Amoxicillin+Clavulanic acid	5(50%)	0(0%)	-
Imipenem	6(60%)	4(44.4%)	3(50%)
Ertapenem	5(50%)	0(0%)	-
Fosfomycin	10(100%)	-	-
Nitrofurantoin	9(90%)	1(11.1%)	0(0%)

E.coli showed maximum sensitivity for fosfomycin (100%) followed by nitrofurantoin (90%). *Klebsiella spp.* showed maximum sensitivity to imipenem (44.4%) followed by cefoperazone + sulbactam and tetracycline (22.2% each). *Pseudomonas spp*. showed maximum sensitivity for imipenem (50%) followed by cefoperazone + sulbactam (33.3%).

All *Enterococcus isolates* showed 100% susceptibility to linezolid and vancomycin. 75 % of the isolates were VRE.

FIGURE 20: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE URINARY ISOLATES

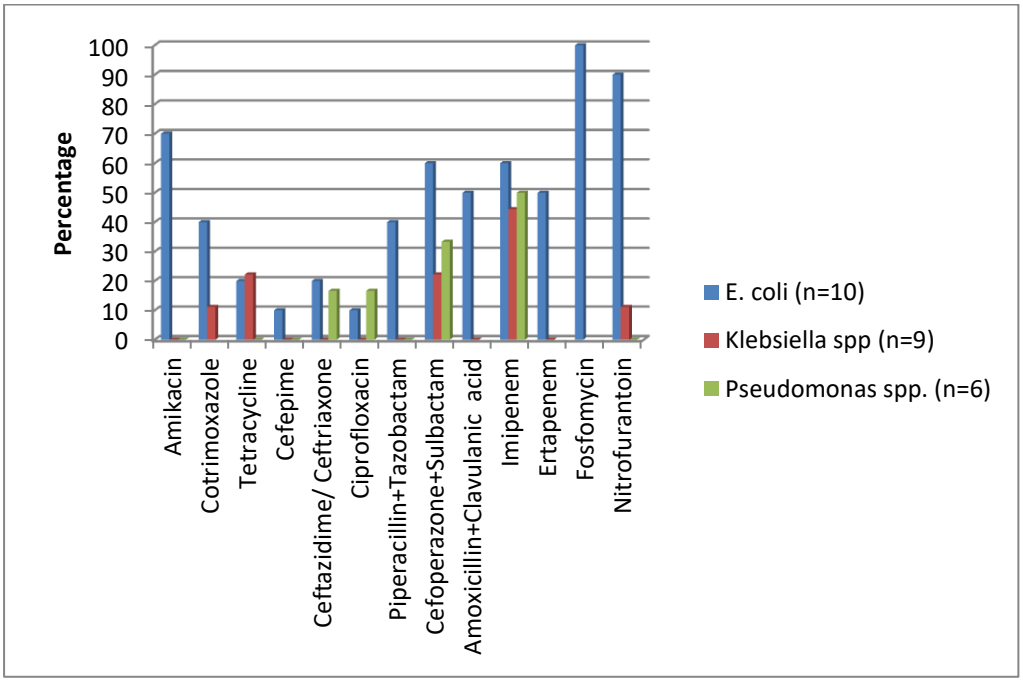

FIGURE 21: DISTRIBUTION OF SKIN AND SOFT TISSUE ISOLATES (n=147)

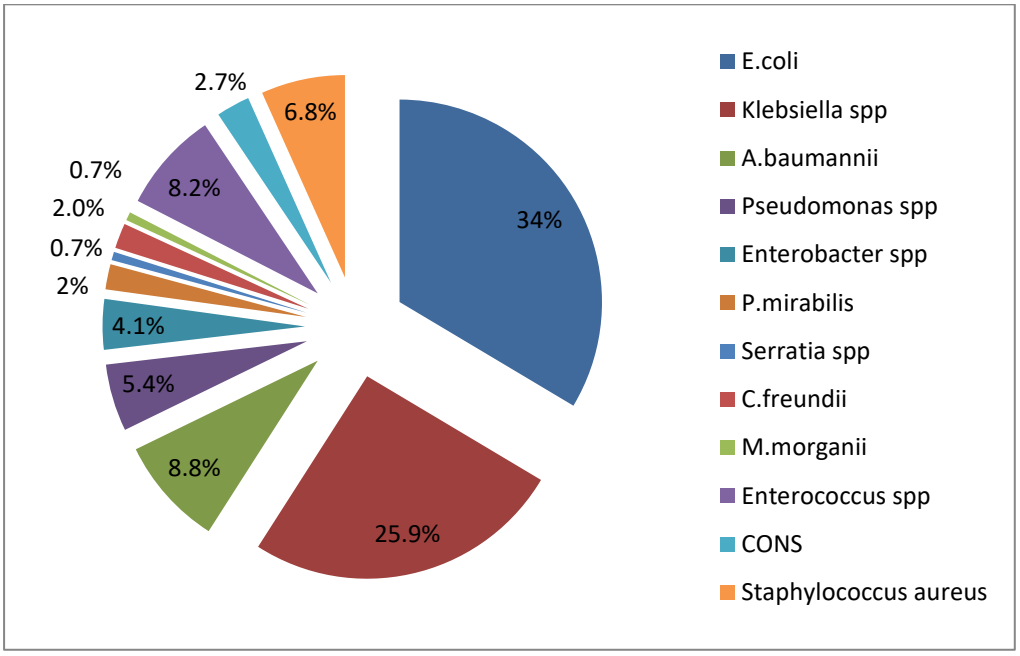

Most common organism causing skin and soft tissue infection was *E.coli*(31.5%) followed by *Klebsiella spp*.(29.9%)

TABLE 35: ANTIMICROBIAL SENSITIVITY PROFILE OF PREDOMINANT GRAM NEGATIVE SKIN AND SOFT TISSUE ISOLATES

BSI	21(13.9)	24(10.7)	45
RTI	55(36.4)	27(12)	82
SSTI	29(19.2)	93(41)	122
UTI	16(10.6)	18(8)	34
Total	151(100)	225(100)	376

Most common type of hospital acquired infections were respiratory tract infections (36.4%) followed by body fluid infections (19.9%) and most common type of community acquired infections were skin and soft tissue infections (41.3%) followed by body fluid infections(28%)

TABLE 39: FLORA OF HOSPITAL VS COMMUNITY ACQUIRED INFECTIONS
(n=420)

	HA	CA
Gram negative isolates	**(n=140)**	**(n=212)**
E.coli	37(22.4%)	88(34.5%)
Klebsiella spp	45(27.3%)	67(26.3%)
Acinetobacter baumannii	33(20%)	23(9%)
Pseudomonas spp	13(7.9%)	15(5.9%)
Others	12(7.2%)	19(7.5%)
Gram positive isolates	**(n=25)**	**(n=43)**
Enterococcus spp	12(7.3%)	18(11%)
CONS	11(6.7%)	11(4.3%)
Others	2(1.2%)	14(5.5%)

In hospital acquired infections, *Klebsiella spp (27.3%)* was the predominant isolate. In community acquired infections, *E.coli*(34.5%) was most common and *Pseudomonas spp* was the least common isolate(5.9%).

FIGURE 25: FLORA OF HOSPITAL ACQUIRED INFECTIONS

(n=165)

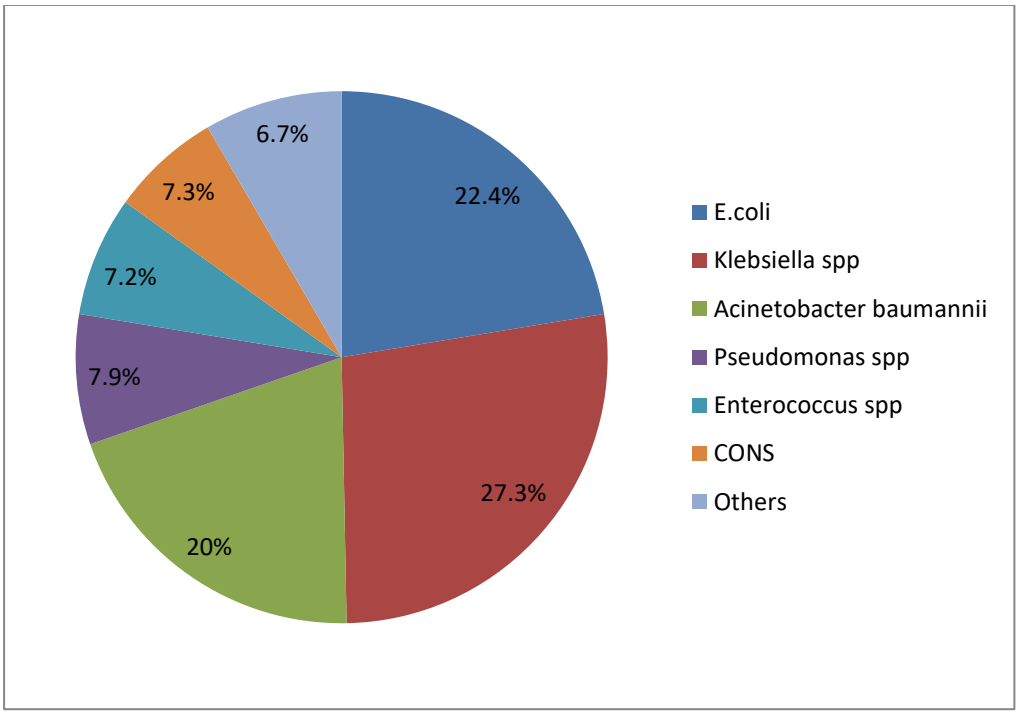

FIGURE 26: FLORA OF COMMUNITY ACQUIRED INFECTIONS (n=255)

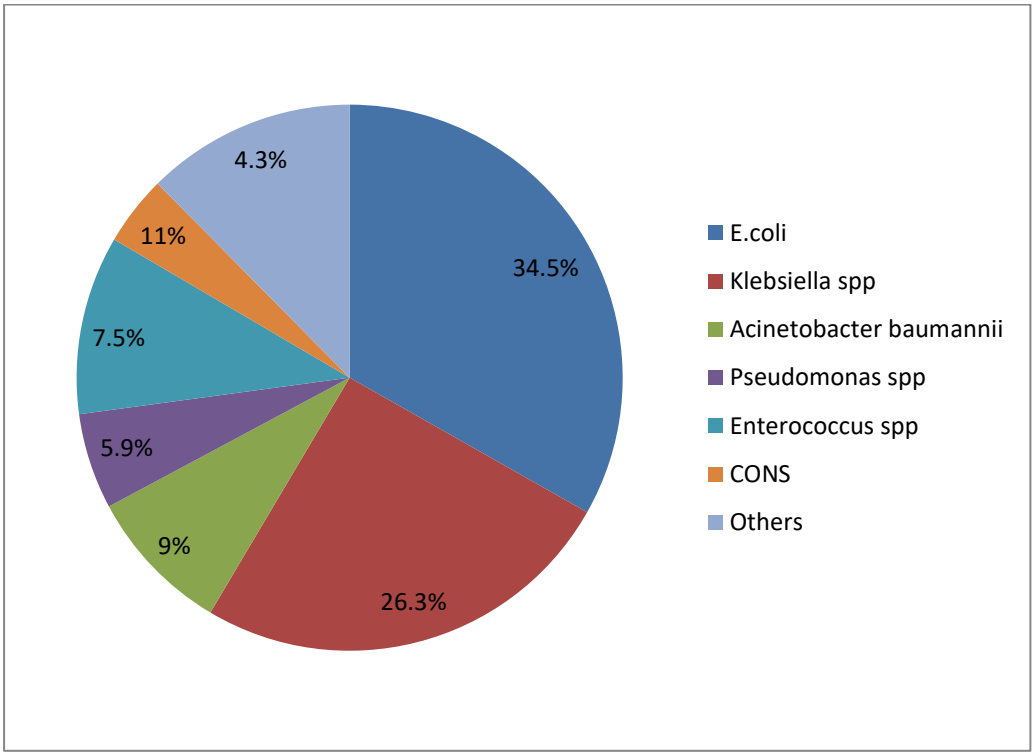

TABLE 40: SAMPLE WISE DISTRIBUTION OF FLORA IN HOSPITAL VS COMMUNITY ACQUIRED INFECTION (n=420)

	BFI		BSI		RTI		SSTI		UTI

Gram positive isolates										
Enterococcus spp	4	5	3	1	1	0	2	10	2	2
CONS	4	2	6	6	0	0	1	3	0	0
Others	0	3	0	1	2	0	0	10	0	0

Most common organism causing body fluid infection was *Klebsiella spp*(30.3%)followed by *E.coli*(27.3%) in hospital acquired infections and in community acquired infections, *E.coli* (49.6%)followed by *Klebsiella spp* (46%) were most common.

Most common organism causing Blood stream infections in both hospital community acquired infections was *E.coli*(23.8%,26%) followed by *Klebsiella spp*(19%,14.3%)respectively

Most common organisms causing respiratory tract infection in hospital acquired infections was *A. baumannii* (40.9%) followed by *Klebsiella spp* (32.8%) and in community acquired infections was *Klebsiella spp* (35.5%) followed by *A.baumannii* (32.3%)

Most common organism causing skin and soft tissue infections in both hospital community acquired infections was *E.coli*(39.4%,32.8%) followed by *K. pneumoniae* (27.3%,29%) respectively.

Most common organism causing urinary tract infection was Pseudomonas spp (23.5%) followed by *Klebsiella spp* and *A.baumanni* (11.8% each) in hospital acquired infections whereas in community acquired infections *E.coli* and *Klebsiella spp* (38.9% each)were the predominant organisms.

TABLE 41: OVERALL ANTIMICROBIAL SUSCEPTIBILITY PATTERN OF GRAM NEGATIVE ISOLATES IN HOSPITAL VS COMMUNITY ACQUIRED INFECTIONS (n=352)

Antibiotics	Hospital acquired infections (n=140)	Community acquired infections (n=212)	p-value
Amikacin	63(45%)	133(62.7%)	0.021
Cotrimoxazole	28(20%)	52(24.5%)	0.322
Tetracycline	16(11.4%)	12(5.7%)	0.051
Minocycline	22(15.7%)	22(10.4%)	0.139
Cefuroxime	4(2.9%)	13((6.1%)	0.161
Cefixime	1(0.7%)	0(0%)	0.215
Cefepime	9(6.4%)	40(18.9%)	0.001
Ceftriaxone	2(1.4%)	11(5.2%)	0.067
Ceftazidime	4(2.9%)	14(6.6%)	0.119
Ciprofloxacin	11(7.9%)	17(8%)	0.956
Piperacillin+Tazobactam	17(12.1%)	48(22.7%)	0.013
Cefoperazone+Sulbactam	38(27.1%)	84(39.6%)	0.016
Amoxicillin+Clavulanic acid	13(9.3%)	31(14.6%)	0.139
Imipenem	26(18.6%)	75(35.4%)	0.001
Ertapenem	20(14.3%)	53(25%)	0.011
Meropenem	21(15%)	68(32%)	0.026
Colistin	118(84.3%)	180(84.9%)	0.874
Tigecycline	53(37.9%)	107(50.5%)	0.02

On comparing sensitive pattern of hospital vs community acquired infections, antibiotics like amikacin, cefepime, piperacillin+tazobactum, cefoperazone+sulbactum, imipenem, ertapenem, meropenem and tigecycline were statistically significant.

TABLE 42: OVERALL ANTIMICROBIAL SUSCEPTIBILITY PATTERN OF GRAM POSITIVEISOLATES IN HOSPITAL VS COMMUNITY ACQUIRED INFECTIONS(n=68)

Antibiotics	Hospital acquired infections(n=25)	Community acquired infections(n=43)	p-value
Penicillin	4(16%)	7(16.3%)	0.963
Gentamicin/HLG	6(24%)	20(46.5%)	0.067
Ciprofloxacin	1(4%)	6(13.9%)	0.196
Levofloxacin	1(4%)	5(11.6%)	0.288
Clindamycin	4(16%)	10(23.3%)	0.478
Erythromycin	2(8%)	9(20.9%)	0.165
Daptomycin	7(28%)	8(18.6%)	0.372
Tetracycline	3(12%)	7(16.3%)	0.633
Cotrimoxazole	3(12%)	14(32.6%)	0.061
Teicoplanin	20(80%)	38(88.4%)	0.351
Vancomycin	18(72%)	35(81.4%)	0.371
Linezolid	23(92%)	41(95.3%)	0.574

On comparing sensitive pattern of hospital vs community acquired infections, none of the antibiotics showed significant difference.

Mean mechanical ventilator days, central venous catheter days and urinary catheter days were more in patients who died and difference was statistically significant.

Blood stream infections were more in patients who died and difference was statistically significant.

DISCUSSION

This prospective study was conducted in the Department of Microbiology, Dayanand Medical College and Hospital, Ludhiana. Over a period of one year, 1010 patients were admitted in surgical ICU and infections were in 345 patients with an infection rate of 34.2%.Out of 345 patients, 4 patients had pulmonary tuberculosis, 48 patients had viral infections, 7 patients had fungal infection and 311 patients had bacterial infections.

In this study, majority of patients with infections (n=345) were in the age group of 61-70 years followed by 51-60 years, similar to study conducted in Surgical ICU in Greece[30] .Majority of patients were males (73.6%) as compared to females (26.4%),in concordance with the study conducted by Baviskar AS et al.(M=76%; F=24%)[79] and in contrast with the study done by Markogiannakis H et al.(M=48.8%; F=51.2%)[30]

Out of 345 patients, 31.6% patients were diabetic, similar to the study by Alexiou K et al.[14]who also observed diabetes as the predominant comorbidity(18%) whereas hypertension is most common in a study done by Banan et al.[80]

20% of the patients with infections were admitted as a result of RSA/ polytrauma, this was in contrast to the study conducted in Maharashtra where majority of patients had admission diagnosis of acute abdomen/abdominal surgery(65.1%).[79]

In our study, ICU infection rate was 34.2%, which was similar to the data reported from other studies[23,79,81] and in contrast to study done by Nazzal (Infection rate=55%).[82]

At present, Invasive fungal infections (IFIs) are becoming more predominant in intensive care infections in both developed and developing countries, with prevalence of aspergillosis to be 0.335% to 8.9%, similar to our study where pulmonary aspergillosis was the predominant fungal infection.[83]

Majority of isolates were Gram negative (83.8%) as compared to Gram positive(16.2%).This was similar to study by Gaynes and Edwards.[84]

On the contrary, study conducted in University Hospital of Ioannina observed equal frequencies of Gram positive and Gram negative isolates[85] whereas Gram positive isolates was predominant in study conducted by Michalopoulos.[86]

Most common type of infections were skin and soft tissue infections (32.4%) followed by body fluid infection (25%), respiratory tract infections(21.8%)similarity to the reports for ICU in other parts of world[79,87], which is contrary to the study conducted by Lola et al.[85](STI accounted for 25%,BFI for 30 % and RTI for 13.3 %).

Majority of isolates obtained from skin and soft tissue samples were Gram negative(83.7%) similar to study by Baviskar and Khatib.[78] The most common Gram negative isolate from soft tissue infections were *E.coli* (31.5%) followed by *Klebsiella spp* (29.9%) and among Gram positive, *Enterococcus spp* (9.8%) was most common. This was similar to the study conducted at other parts of India[88,89] which also showed *E.coli* as the predominant organism which differs from the study done at the University Clinics in Skopje[90]

In the present study, among skin and soft tissue infections, *E.coli* was highly sensitive to tigecycline (90%) followed by amikacin (76%) and least sensitive to tetracycline and cefepime (2% each),findings are similar with other studies.[91,92]

Among the body fluid samples, the most common Gram negative organism isolated was *E.coli* (43.9%)followed by *Klebsiella spp* (26.5%),similar with the study done by Rouf and Nazir [93] who also reported *E.coli* as most commonly isolated organism.

Antimicrobial susceptibility pattern among Gram negative isolates showed that *E.coli* was highly sensitive to amikacin (81.4%) followed by tigecycline (70.1%) and was found to be least sensitive to cephalosporins (9.3%) and fluoroquinolones (2.3%),findings are similar to the study done at Dhaka.[94]

Among the respiratory samples, *A.baumanni* (38%) was predominant isolate followed by *Klebsiella spp* (33.7%), *E.coli(*12%).This finding was similar to studies done by Taghreed and Sahu[95,96] who also reported *A.baumanni* as most common isolate which differs from the study done

by Goel et al.*where Pseudomonas(*35%) is common organism isolated in respiratory samples followed by A.baumannii.[97] *A.baumannii and Klebsiella spp* showed high level of resistance towards cephalosporins and ciprofloxacin, our findings are similar with other studies.[98,99]

The most common Gram negative organism isolated from blood sample was *E.coli* (23.9%) similar to the study done in ICUs in Ahmadabad[100] and differs from the study by Orsini et al[101] in which *Klebsiella spp* was the common Gram negative isolate. In our study, E.coli was susceptible to amikacin (72.7%) followed by imipenem, ertapenem, meropenem and cefoperazone+sulbactum (54.5% each).There results were in accordance with the study by teaching hospital in North India.[20]

In urine samples, the most common Gram negative organism was *E.coli* (28.6%)followed by *Klebsiella spp* (25.7%).This was similar to NHSN report 2008.[99] Maximum sensitivity was observed towards fosfomycin, nitrofurantoin, amikacin ,consistent with the findings of other studies.[102,103]

In our study. out of 420 isolates, 83.3% were multidrug resistant and 66.4% were extensively drug resistant. No isolate in our study was pan drug resistant. This is in contrast to other studies where 34.2% and 73.9% isolates were multi drug resistant.[104,105]

Among Gram positive isolates, methicillin resistance was detected in 13.3% of *S.aureus* isolates and 31.8% of coagulase negative staphylococci, which was lower as compared to the study done by Edmond MB et al.[60] (MRSA-29.3 %;MRCONS-80%).The proportion of vancomycin resistance among *Enterococci spp* was 23.3% whereas in systemic review and meta analysis done by Smout E ,VRE rate was 12.4%.[106]

59.8% infections were community acquired and 40.2% were hospital acquired. Most common type of hospital acquired infections were respiratory tract infections (36.4%) followed by body fluid infections(19.9%).This was similar to the one day prevalence survey done in Lebanon[38] and in contrast to study by Al-Ghamdi and Gedebou where UTI was the most hospital acquired infection.[107]

Most common organism causing respiratory tract infection in hospital acquired infection was *A.baumannii* (40.9%) followed by *Klebsiella spp* (32.8%) which is similar to a study from Poland[108] which stated *A.baumannii* (41%)as the primary cause of pneumonia in ICUs. Most common organism causing body fluid infection in hospital settings was *Klebsiella spp*(30.3%) followed by *E.coli (*27.3%).This is higher when compared to a study from India which revealed that Klebsiella spp. (19.6%), Pseudomonas spp. (11.9%) were the most frequently isolated organisms from patients with HA-BFI.[109]

Most common type of community acquired infection was skin and soft tissue infections (41%) followed by body fluid infections (28%), which was in contrast to study by Todorovic and Pedersen where respiratory tract infection (39%) was the most community acquired infection.[110]

Most common organism causing skin and soft tissue infection was *E.coli* (32.8%) followed by *K.pneumoniae* (29%) whereas *S.aureus* was the predominant isolate in a study by Morgan et al.[111]

In this study, device associated infections were 11.Out of 11, most common isolate was *A.baumannii* (27.3%) followed by *E.coli* (18.2%), *K.pneumoniae* (18.2%),*Enterococcus faecium* (18.2%),similar to the study in Poland and Italy which also showed higher predominance of *A.baumannii* infections.[112,113]

In our study, overall Device Associated Infections(DAIs) rate was 0.92 infections per 1000 ICU-days, which was much lower as compared to the study conducted in intensive care units in Shanghai, China(DAI rate= 5.3%)[114]

Mean APACHE score of infected patients was 14.86, similar to the study conducted in Eastern India [10] and in contrast to the study done in Greece.[30]

Rate of VAP, CAUTI, CLABSI in our study was 0.81, 1.2, 0.75 per 1000 device days respectively. Our findings showed lower rates as compared to study by Mehta et al.,for VAP(0.81 vs 10.46)and CAUTI(1.2 vs 1.41) and CLABSI(0.75 7.92). Overall, DA-HAI rates were much lower (0.92 vs 4.4).[20]

Length of stay (LOS) of patients with infections was 7.34 days and those without infection was 4.45 days($p<0.001$), whereas the study conducted by INICC Malaysia report 2016 reported ICU stay days for 9.4 days.[20] The mortality in patients with infections(34.2%) were more as compared to those without infections(23.6%), this was in concordance with the other studies where mortality rates vary from 10% to 40%.[23,81] This suggests that ICU infections are associated with increased hospital stay, morbidity and mortality.

The increasing drift of resistance among the hospital acquired organisms such as MRSA and VRE pose a great warning to health care workers as well as to critically ill patients of the ICUs. Hence, there is need to choose appropriate empirical therapy and escalation-de-escalation of antibiotics, so that resistance in emerging pathogens can be reduced easily. Treatment options for infections caused by pathogens are limited. Thus, this study is useful for surveillance and for early treatment of patients.

SUMMARY AND CONCLUSION

- This prospective study was conducted in the Department of Microbiology, Dayanand Medical College and Hospital over a period of one year.
- A total of 1010 patients were admitted in surgical ICU. On the basis of clinical suspicion, various samples (respiratory, blood, body fluids, urine and soft tissue) were collected and processed as per standard protocol.
- Maximum number of admitted patients (n=1010) were from the age group of 61-70 years followed by 51-60 years. Mean age and standard deviation of admitted patients was 51.08 and 18.43 respectively.
- Majority of admitted patients were males (70.5%) as compared to females (29.5%).
- Majority of patients were admitted as a result of RSA/Polytrauma (28%).
- Maximum number of admitted patients had ICU stay upto 7 days(Mean=5.4)
- Mean APACHE 2 score in admitted patients was 14.8.
- Infections were present in 345 patients with an infection rate of 34.2%.
- Majority of patients with infections(n=345) were in age group of 61-70 years followed by 51-60 years. Mean age and standard deviation of patients with infection was 51.33 and 18 respectively.
- Majority of patients with infections were males (73.6%) as compared to females (26.4%).
- Out of 345 patients, 249 were having comorbidities .Most of the patients were diabetic (31.6%) .
- Most common risk factor was sepsis observed in 31.5% of cases.
- Out of 1010 patients admiited, 7 patients had fungal infection,48 patients had viral infection,4 patients had tuberculosis and 311 patients had bacterial infection.
- Most common fungal infection was Pulmonary Aspergillosis.

- All Aspergillus isolates were susceptible to itraconazole, Posaconazole and Amphotericin B.
- Total 376 infections were characterized and 420 isolates were obtained, Out of 420 isolates,352 (83.8%) were Gram negative and 68(16.2%) were Gram positive isolates.
- Most common type of infections were skin and soft tissue infections (32.4%) followed by body fluid infections (25%).
- In Gram negative isolates, *E.coli* (35.5%) was the most common isolate followed by *K.pneumoniae* (31.2%). In Gram positive isolates, *E.faecium* (23.5%) were most common followed by *S.aureus* (22%)
- Gram negative isolates showed low susceptibility to ceftriaxone (3.7%).ceftazidime (5.1%) while isolates were highly susceptible to amikacin (55.4%) and tigecycline (45.5%). Gram positive isolates showed low susceptibility to levofloxacin (8.8%),ciprofloxacin (10.3%) and penicillin(11.8%) whereas high sensitivity was seen for linezolid(94.1%),teicoplanin (85.3%) and vancomycin (77.9%)
- Out of 420 isolates, 350 (83.3%) were multidrug resistant and 279(66.4%) were extensively drug resistant.
- Methicillin resistance was detected in 13.3% of *S.aureus* isolates and 31.8% of coagulase negative staphylococci. VRE was detected in 23.3% of *Enterococcus spp.*
- Most common organism causing body fluid infection was *E.coli* (43.9%) followed by *Klebsiella spp* (26.5%) and *Enterococcus spp* (9.1%). *E.coli* showed maximum sensitivity for amikacin (81.4%)followed by tigecycline (70.1%).
- Most common organism causing blood stream infection was *E.coli* (23.9%)followed by *Klebsiella spp* (17.4%).*E.coli* showed maximum sensitivity for amikacin(72.7%) followed by imipenem, ertapenem, meropenem and cefoperazone+sulbactum (54.5% each).
- Among the respiratory samples, *A.baumanni* (38%) was predominant isolate followed by *Klebsiella spp* (33.7%) and *E.coli*

*(*12%). *A.baumannii* showed maximum sensitivity for minocycline (54.3%) followed by cefoperazone+sulbactum (31.4%).

- Most common organism causing urinary tract infection was *E.coli* (28.6%) followed by *Klebsiella spp* (25.7%).*E.coli* showed maximum sensitivity for fosfomycin (100%) followed by amikacin(70%).
- Among skin and soft tissue infection, the most common isolate was *E.coli* (31.5%) followed by *Klebsiella spp* (29.9%) and among Gram positive, *Enterococcus spp*(9.8%) was most common. *E.coli* showed maximum sensitivity for tigecycline (90%) followed by amikacin (76%).
- 59.8% of infections were community acquired and 40.2% were hospital acquired.
- Most common type of hospital acquired infections were respiratory tract infections(36.4%) followed by body fluid infections(19.9%) and most common type of community acquired infections were soft tissue infections(41.3%) followed by body fluid infections(28%).
- Most common organism causing hospital acquired infections was *Klebsiella spp* (27.3%) followed by *E.coli* (22.4%) and most common organism causing community acquired infections was *E.coli* (34.5%) followed by *Klebsiella spp (*26.3%).
- Most common device related infection was CAUTI. Most common organism isolated *A.baumanni* (27.3%).
- Overall, device related infection rate was 0.92 per 1000 device days. CAUTI rate was 1.2 per 1000 catheter days, VAP rate was 0.81 per 1000 ventilator days, and CLABSI rate was 0.75 per 1000 central line days.
- Out of 345 patients, 227(65.8%) survived and 118(34.2%) expired.

No. BFUHS/2K23p-TH/ 13219 Date 29/12/23

The Principal
Dayanand Medical College & Hospital
Ludhiana

Subject:: Approval of Plan of Thesis.

This is to inform you that the Faculty of Medical Sciences in its meeting held on 25.09.2023 has approved the plan of thesis of **Amarpreet Kaur**, a student of your college for **MD Microbiology** along with the names of Supervisor/Co-Supervisor as under:-

Topic Plan of Thesis
To study epidemiology, clinical and microbiological profile of infections in patients admitted to surgical icu .

Supervisor
Dr. Veenu Gupta
Prof. & Head
Dept. of Microbiology

Co-Supervisor:-
Dr. P L Gautam
Prof. & Head
Dept. of Critical Care Medicine

The student may submit the thesis in triplicate alongwith the plan in triplicate also, to the Controller of Examinations, BFUHS, Faridkot, at least six months before the commencement of theory examination, if he/she is otherwise eligible to take the examination. He /She may be directed to attach a photocopy of this letter with the forwarding letter while submitting thesis in the University along with the letter of approval of University for change of supervisor/Co-Supervisor, change of topic, if any.

Controller of Examinations

Note :

1. *If any discrepancy found regarding topic of thesis or Supervisor/Co-Supervisor, inform undersigned within one month after issue of this letter.*

TO STUDY EPIDEMIOLOGY, CLINICAL AND MICROBIOLOGICAL PROFILE OF INFECTIONS IN PATIENTS ADMITTED TO SURGICAL ICU

THESIS PROPOSAL

FOR APPROVAL OF SUBJECT OF THESIS TO BE SUBMITTED IN

PARTIAL FULFILMENT OF THE REQUIREMENTS

FOR THE DEGREE OF

MD

In

MICROBIOLOGY

OF THE

BABA FARID UNIVERSITY OF HEALTH SCIENCES

FARIDKOT

AUGUST, 2022

DR. AMARPREET KAUR

DEPARTMENT OF MICROBIOLOGY
DAYANAND MEDICAL COLLEGE AND HOSPITAL
LUDHIANA

ABSTRACT OF PLAN OF THESIS

Title	TO STUDY EPIDEMIOLOGY, CLINICAL AND MICROBIOLOGICAL PROFILE OF INFECTIONS IN PATIENTS ADMITTED TO SURGICAL ICU
For the degree of	MD MICROBIOLOGY
Name of the candidate	Dr. Amarpreet Kaur
Supervisor	Dr. Veenu Gupta, Professor & Head, Department of Microbiology, DMCH, Ludhiana
Co-Supervisor	Dr. P L Gautam, Professor & Head, Department of Critical Care Medicine, DMCH, Ludhiana
Institution	Dayanand Medical College and Hospital, Ludhiana
University	Baba Farid University of Health Sciences, Faridkot

Introduction: Infections are a common, severe problem worldwide, associated with significant morbidity and mortality as well as rapidly increasing multi-drug resistance of the responsible microorganisms to antibiotics. Intensive care unit (ICU) patients are at greater risk of developing a hospital infection and, moreover, resistance rates of pathogens isolated in ICU infections to antimicrobial agents are substantially higher.

Aims and Objectives: To study the Epidemiology,Clinical and Microbiological profile of infections in patients admitted to Surgical ICU.

Materials and Methods: This prospective study will be conducted over a period of one year in the department of Microbiology, DMCH Ludhiana. All patients admitted in Surgical ICUs will be included in the study. Depending on the clinical suspicion,various samples received in the department will be processed as per standard protocol.Identification and AST (Antibiotic Susceptibility Testing) of the isolates will be done by Vitek 2 System and will be characterised into MDR, XDR or PDR. The Infections will be characterised into Bacterial/ Parasitic/ Fungal/ Viral, Respiratory/Urinary/Blood stream/Body fluids/SSI,Hospital acquired(HA)/Community acquired(CA), Monomicrobial/ Polymicrobial infections, Single episode/Multiple episode.Device associated infection rate (VAP, CLABSI, CAUTI) will be calculated.

Clinical significance: Infections are an important cause for prolonged hospitalisation, leading to increased treatment costs so this study will be useful for checking antibiotic susceptibility pattern and early treatment of patients.

Keywords: multidrug resistance, antimicrobial agents.

CERTIFICATE OF FACILITIES AVAILABLE

This is to certify that the facilities for work on the subject of thesis titled **"TO STUDY EPIDEMIOLOGY, CLINICAL AND MICROBIOLOGICAL PROFILE OF INFECTIONS IN PATIENTS ADMITTED TO SURGICAL ICU"** exist in the Department of Microbiology at Dayanand Medical College and Hospital, Ludhiana and will be provided to the candidate. We will see that the data being included in the thesis are genuine and is collected by the candidate herself under our supervision and guidance.

PROFORMA FOR REGISTRATION OF SUBJECT FOR DISSERTATION

1	NAME OF THE CANDIDATE	DR. AMARPREET KAUR, Vill. Abhowal Post office Bhunga, Dist. Hoshiarpur, Punjab, Pin. 144210
2	NAME OF THE INSTITUTE	DAYANAND MEDICAL COLLEGE AND HOSPITAL, LUDHIANA
3	COURSE OF STUDY AND SUBJECT	MD MICROBIOLOGY
4	DATE OF ADMISSION OF COURSE	7th March 2022
5	TITLE OF THE TOPIC	TO STUDY EPIDEMIOLOGY, CLINICAL AND MICROBIOLOGICAL PROFILE OF INFECTIONS IN PATIENTS ADMITTED TO SURGICAL ICU.

6. BRIEF RESUME OF THE INTENDED WORK

6.1 NEED FOR THE STUDY

Infections are one of the most important causes of mortality in the world, more in the low and lower-middle income countries. The global burden of diseases study reported that although the mortality due to infections has decreased in the last 30 years, still they remain an important cause of death and disability. A nosocomial infection is defined as an infection that is not present or incubating when the patient is admitted to hospital or other health care facility. It has been reported that the incidence of nosocomial infections in the intensive care unit (ICU) is about 2 to 5 times higher than in the general in-patient hospital population.[1] It is invariably associated with poor outcomes especially when adequate antimicrobial therapy and source control are delayed.[2] Delayed effective therapy is associated with worse outcome. Fast and accurate diagnosis of the causing microorganism and a correct susceptibility testing improves the care of patients with sepsis and leads to a more precise therapy which grows in importance with antimicrobial resistance increase.[3]

Multiple factors are responsible like rapid urbanization, aging of population, and emerging viral and bacterial infections-combined with the age-old upstream predisposing factors such as poverty, inequality, and illiteracy.[4]

There is a strong relation between presence of infection and length of ICU stay and mortality as well as a significant inverse relation between the prevalence of infections and extent of government health care expenditure.[5] Nosocomial infections (NI) are of great epidemiological relevance by raising the morbidity and mortality rates, extending the length of stay of patients in hospital and thus burdening the cost of treatment.[3] Infection and related sepsis are the leading cause of death in noncardiac ICUs, with mortality rates that reach 60% and account for approximately 40% of total ICU expenditures.[5]

An ICU patient has 5 to 7 folds higher risk of HAI and ICU infections contributes to 20% to 25% of all HAI in a hospital. It leads to increased length of ICU and hospital stays. The incidence of HAI in ICU are 4-5 times higher than in general population. This study will be helpful for early diagnosis and to study the Epidemiology, Microbiological and Clinical profile of infections in patients admitted to Surgical ICU. A major challenge for intensivist is to initiate adequate antimicrobials promptly for patients with severe infections while at the same time minimizing the overall risk of development of antimicrobial resistant organisms within ICUs through prudent antibiotic use.[6] Hence, this short term study was undertaken to detect the incidence of multidrug-resistant (MDR), extensively drug-resistant (XDR), and pandrug-resistant (PDR) bacterial isolates in a tertiary care hospital. The antibiotic susceptibility profile of different bacterial isolates will be studied to detect MDR, XDR, and PDR bacteria. Increasing rates of antimicrobial resistance, changing patterns of antimicrobial usage and the wide application of new medical technologies (e.g., indwelling catheters and other devices) may change the epidemiology and outcome of bloodstream infection. It is therefore important to continually review and update the epidemiology and outcome of infection, including an examination of the variables most strongly associated with mortality.[7] Treatment options for infections caused by pathogens are limited. Thus, this study will be useful for surveillance and for early treatment of patients.

6.2 REVIEW OF LITERATURE

Nosocomial infections are a major threat to the patients' safety in all health-care facility.[8] The common nosocomial infections are respiratory tract infections (bronchitis, pneumonia), urinary tract infections (UTI) (cystitis, pyelonephritis), bloodstream infections (BSI) (septicemia), skin and soft tissue infections (SSTIs) including surgical site infections.[9] The high incidence of infection and multidrug resistance in ICU patients is attributable to severe medical underlying condition, frequent and, sometimes, unnecessary use of broad-spectrum antibiotics, mechanical ventilation, utilization of several devices placed with interventional techniques, prolonged hospital stay, and greater risk of cross transmission of resistant microorganisms.[10] However, the prevalence is much higher in the ICUs than other areas of the hospital.[11,12] ICUs have contributed greatly to the survival of patients with trauma, shock states, and other life-threatening conditions, but are associated with a greatly increased risk of nosocomial (hospital-acquired) infection. Rates of nosocomial infection in patients requiring more than 1 week of advanced life support within an ICU are three to five times higher than in hospitalized patients who do not require ICU care. Infection, usually nosocomial, is the most common cause of death, directly or indirectly, of patients who survive the early period after major trauma and is the most commonly identified cause of multiple-organ dysfunction syndrome.[6]

Approximately 40% of endemic nosocomial infections within ICUs are catheter-related blood stream infections (CRBSI) and 25% are pneumonias—most associated with endotracheal intubation and mechanical ventilator support. CRBSI accounts for 10% to 20% of hospital-acquired infections and is associated with both increased ICU stay and mortality. Rates of CRBSI may be modified by clinical care during insertion and utilization of CVCs. The incidence of CRBSI varies considerably by type of catheter, frequency of catheter manipulation, and patient-related factors, such as underlying disease and severity of illness.[13] Up to 10% of patients hospitalized in a surgical ICU for more

than 72 hours acquire a nosocomial bloodstream infection, most commonly from an intravascular device. Postoperative surgical site infections and intra-abdominal infections; nosocomial bacteremias; and gastrointestinal infections, especially antibiotic-associated Clostridium difficile colitis account for the remainder.[14]

Out of 3034 infectious episodes recorded at ICU admission (crude incidence: 21.1%), patients hospitalised longer than 24 hours were 1581 infectious episodes (crude incidence: 18.9%) including 713 (45%) in patients already infected at ICU admission. These rates varied between ICUs. Respiratory, digestive, urinary tracts, and primary bloodstream infections represented about 80% of all sites. Hospital-acquired and ICU-acquired infections were documented more frequently microbiologically than community-acquired infections (71% and 86%, respectively vs. 55%). About 28% of infections were associated with sepsis, 24% with severe sepsis and 30% with septic shock, and 18% were not classified. Crude hospital mortality rates ranged from 16.9% in non-infected patients to 53.6% in patients with hospital-acquired infections at the time of ICU admission and acquiring infection during the ICU stay.[6] The attributable mortality from nosocomial bloodstream infection is high in critically ill patients. The infection is associated with a doubling of the SICU stay, an excess length of hospital stay of 24 days in survivors, and a significant economic burden.[15]

Out of 1408 patients were admitted to the surgical ICU ,350 patients had evidence of nosocomial infections (prevalence rate 33.30%). SSTIs were the most common (36.30%) followed by respiratory tract infections (24.46%) and genitourinary infections (23.4%) .The most common causative microorganism for nosocomial infection was *E.coli*, *Acinetobacter*, *Klebsiella*,and *Pseudomonas.* Approximately half of the patients are more than 60 years of age with 3/4th being male. Two-third of the patients had a clinical diagnosis of acute abdomen or had abdominal surgery. Gram-negative bacteria were the most

common microorganism cultured from the samples collected in patients with nosocomial infections. The average ICU stays of patients with and without nosocomial infections were 14.4 and 5.4 days, respectively.[9]

Nearly 50% of nosocomial infections in the ICU are caused by aerobic Gram-negative bacilli, especially *Pseudomonas aeruginosa, Enterobacter* species, or *Serratia marcescens*; and 35% are caused by Gram-positive cocci, most commonly coagulase-negative *Staphylococci* or *Staphylococcus aureus* or, increasingly, resistant enterococci. Almost 15% are caused by Candida species, but filamentous fungi such as *Aspergillus* and *Zygomycetes* are being increasingly encountered in patients with hematologic malignancy or those who received solid organ transplants. Viruses such as respiratory syncytium virus (RSV) and rotaviruses are important pathogens in pediatric ICUs. Legionella species now account for up to 10% of nosocomial pneumonias in centers that make efforts to diagnose Legionella infections.[14]

The high prevalence of these organisms in the ICUs emphasizes the need for an early detection of the B-lactamase producing organisms by simple screening methods, which can help in improving an appropriate antimicrobial therapy. The need of an hour is that every heath care institution must develop its own antimicrobial stewardship program which is based on the local epidemiological data and international guideline to optimize the antimicrobial use among hospitalized patients, to improve the patient outcomes, also to ensure a cost effective therapy and to reduce the adverse consequences of the antimicrobial use[16]

6.3 AIMS AND OBJECTIVES OF THE STUDY

- To study the Epidemiology and Clinical Profile of infections in patients admitted to Surgical ICU.
- To study Microbiological profile of infections.

7. MATERIALS AND METHODS

The present prospective study will be conducted in the department of Microbiology, DMCH Ludhiana.

7.1 Source of Data:

Depending on the requisition, various samples received in the Microbiology department will be processed.

7.2 METHOD OF COLLECTION OF DATA

Inclusion Criteria: All patients admitted in Surgical ICU

Exclusion Criteria: All Patients admitted in OPD, wards.

The following data is collected:-Name, age, sex. date of admission, MRD No., Date of specimen collection, Risk factors,Severity of Episodes(APACHE 2 score), Investigations, Empirical Treatment, Target treatment, Outcome.

DURATION OF STUDY

The present prospective study will be conducted over a period of 1 year in department of Microbiology, Dayanand Medical College and hospital, Ludhiana.

SAMPLE PROCESSING

Various specimens like Blood, Body fluids, CSF, Respiratory(ET secretions, BAL, sputum) Urine, Pus/ Wound swab/ Tissue, Stool received in Microbiology lab will be processed as per standard protocols[17]

DIRECT EXAMINATION-

- Gram staining will be performed directly from the sample.
- KOH mount- 10-20% KOH will be used for identification of fungal elements.
- ZN staining – smear will be prepared for detection of acid fast bacilli.

- For CSF samples-wet mount preparation, India ink preparation, bacterial antigen and Cryptococcal antigen.
- For stool samples-saline and Iodine mount preparation,Rapid antigen test for Cryptosporidium/Giardia/Entamoeba and GDH,Toxin A,Toxin B for Clostridium difficle will be processed if indicated.

BACTERIAL CULTURE-

- Blood and body fluid specimens will be processed in the BACTEC 9240 or BacT/Alert microbial detection system. Blood culture bottles will be loaded in the instrument and incubated for a maximum period of 7 days or till the bottle flagged by the system and time of positivity is noted. Smears will be prepared from positive blood culture bottles and gram staining will be done, The Positive bottles will be subcultured on Blood Agar and MacConkey agar plate.
- Urine, respiratory samples, pus, wound swabs,stool etc will be cultured on blood and MacConkey agar and incubated at 37*C for 24-48 hrs.
- Identification and AST(antibiotic sensitivity testing) of the isolates will be done by Vitek 2 system.

CHARACTERIZATION OF ISOLATES:-

The isolates will be characterized on the basis of antibiotic resistance as follow:[18]

- MDR: The isolates acquired non-susceptibility to at least one agent in three or more antimicrobial categories.
- XDR: The isolates showed non susceptibility to at least one agent in all but two or fewer antimicrobial categories (i.e. bacterial isolates remain susceptible to only one or two categories)
- PDR: The isolates showed non-susceptibility to all agents in all antimicrobial categories.

- In Salmonella spp. multiple-drug resistance (MDR), defined as resistance to ampicillin, chloramphenicol, and trimethoprim-sulfamethoxazole.

MYCOBACTERIAL CULTURE- After decontamination/ centrifugation/homogenization, sample will be cultured on LJ medium for 8 weeks .ZN staining will be performed from the growth obtained to confirm the diagnosis.

FUNGAL CULTURE- Samples will be cultured on 2 sets of Sabourauds dextrose agar (with and without cycloheximide) and incubated at 25°C and 37° C for 2 days. Identification of the isolates will done by Gram staining, germ tube testing and lactophenol cotton blue mount. Identification and susceptibility of yeast isolates will be done by Vitek 2 System.

SEROLOGICAL TESTS: Request received for anti HAV/HBsAg/anti HCV/anti HEV/anti HIV/Dengue NS1 antigen/Dengue IgM /Leptospira IgM/Scrub typhus IgM/Chickungunya IgM/Typhiwell/Widal/Brucella agglutination test/ Malaria antigen received in the department will be processed as per manufacturer's instructions.

MOLECULAR TESTS:Requests received for Catridge Based Nucleic Acid Amplification Test(CBNAAT)/Line Probe Assay(LPA)/ Biofire Filmarray Multiplex PCR/HBV DNA/HCV RNA PCR) will be done as per kit protocol.

CHARACTERISATION OF INFECTIONS

- Bacterial/Parasitic/Fungal/Viral Infections.
- Respiratory/Urinary/Blood/Body Fluids/Surgical Site Infection- Infection rate will be calculated depending upon the number of patients who developed the infection.
- Hospital acquired (HA)/Community acquired(CA)Infections
  - ✓ HA(Infections that occurred 48 hours after hospital admission)

- ✓ CA(Infections occurring <48 hours after hospital admission)[19]

- Monomicrobial /Polymicrobial Infections
  - ✓ Monomicrobial(It is defined as the isolation of one pathogen from the same sample)
  - ✓ Polymicrobial(if two or more pathogens were isolated from cultures of samples obtained within 48 h after the initial evaluation, irrespective of whether the isolate came from the same or different culture bottle)
- Single Episode/Repetitive Episodes of Infections.
- Device associated infection rate(VAP,CLABSI,CAUTI)-calculated depending upon the number of days of indwelling device.

OUTCOME: Patient discharged / death

STATISTICAL ANALYSIS

Data will be described in terms of range; mean ± standard deviations (±SD) frequencies (number of cases) and relative frequencies (%age) as appropriate. All statistical calculations will be done using SPSS (statistical package for the social sciences). SPSS 21 version statistical program for Microsoft windows.

7.3 DOES THE STUDY REQUIRE ANY INVESTIGATIONS OR INTERVENTIONS TO BE CONDUCTED ON PATIENTS OR OTHER HUMANS OR ANIMALS? IF SO, PLEASE DESCRIBE BRIEFLY.

No

7.4 HAS ETHICAL CLEARANCE BEEN OBTAINED FROM YOUR INSTITUTION IN CASE OF 7.3?

Yes, Attached herewith.
